ADMINISTRATION

2 · Organization setup

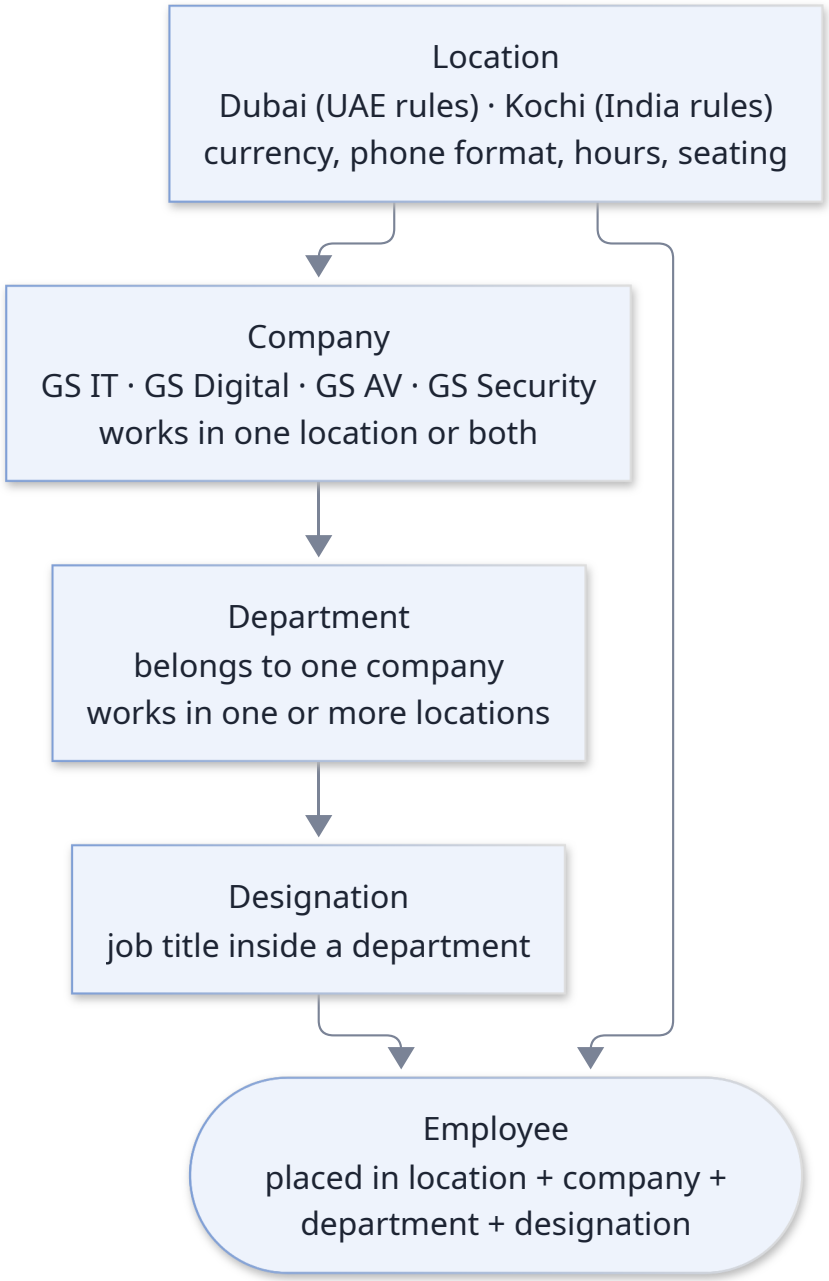

The master data every other module depends on: locations, companies, departments and designations. Set up once, changed rarely.

Used by	Super Admin · HR · Office Admin edit · everyone reads (dropdowns)
Frontend	`/admin/companies` , `/admin/structure` , `/admin/settings` (locations), `context/OrgContext.tsx`
Backend	Phase 0 — companies, locations, departments and designations built and connected to the frontend

In short

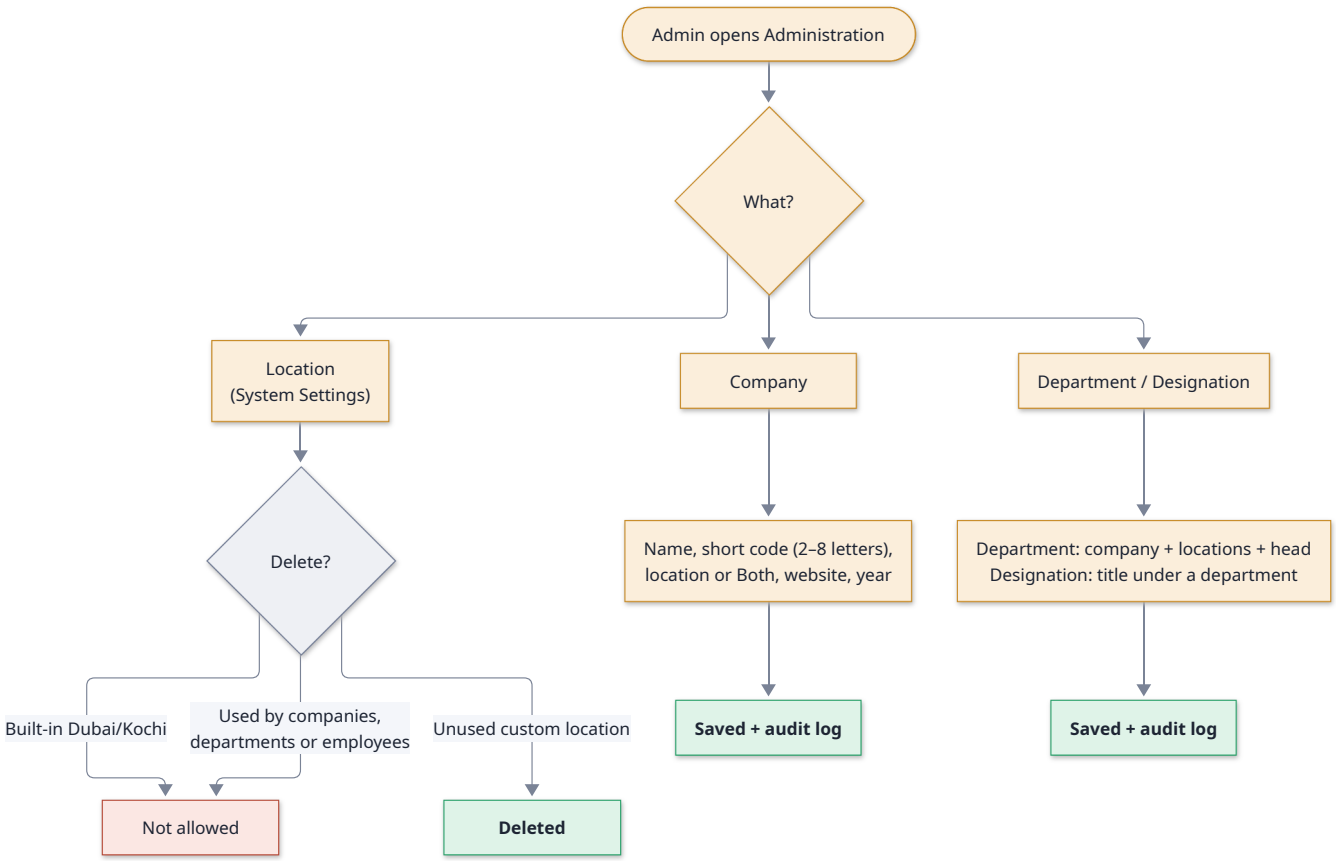

1. **Locations** (Dubai, Kochi) carry the country rules.
2. **Companies** work in one or both locations; **departments** belong to a company; **designations** are job titles in a department.
3. Every employee is placed in a location, company, department and designation.

How the pieces fit

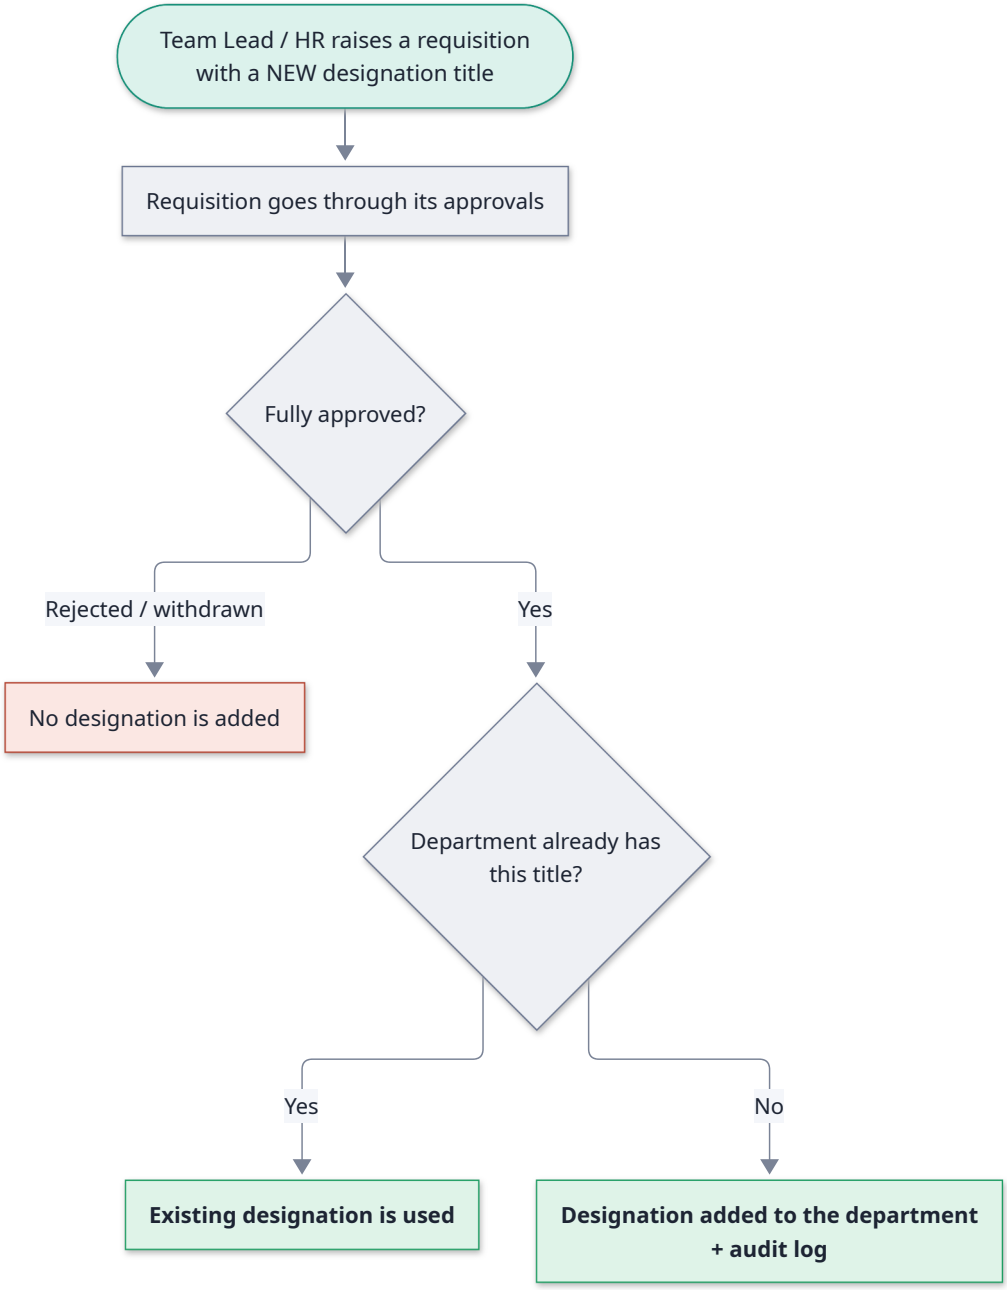

"Sales" can exist in several companies — a department always belongs to exactly one company.

Adding and changing

1. **Locations** decide the country rules: which ID fields an employee has, currency, bank format, holidays and leave types.
2. **Companies** are business units. A company works in Dubai, Kochi or both.
3. **Departments** belong to a company and list the locations they operate in. When an employee is placed, the department must belong to their company *and* operate in their location.
4. **Designations** are the job titles inside a department.
5. Every change is recorded in the audit log (module "Organization").

A new designation asked for on a requisition

The requisition side of this flow is in chapter 8 (Hiring).

Not in the frontend yet

- Without a backend (hosted preview) changes are kept only in the browser and are lost on refresh.
- A department head cannot be chosen yet: the picker waits for the employee directory to be connected.
- A company's founding year can be set but not cleared.
- A designation from an approved requisition is only added in the browser; the server must add it when the requisition is fully approved.
- Employees store company/department/designation as **names**; the backend uses ids, so renaming is safe.
