GLOBAL SURF IT · DUBAI & KOCHI

GS HRMS — Module flows

How every module works, step by step, in plain language. Based on the frontend prototype (gs-hrms). Use it to understand the system before building or testing the backend.

Generated 2026-10-23. Source: `flow/src/` in the backend repository.

Contents

9. 8 · Hiring
10. 9 · Leave
11. 10 · Attendance, overtime and payroll output
12. 11 · Expense claims
13. 12 · Performance and learning
14. 13 · Notifications, workflow and audit
15. 14 · Dashboards and reports

START HERE

0 · System overview

GS HRMS is one system for every Global Surf employee in Dubai (UAE) and Kochi (India), across four companies: GS IT, GS Digital, GS AV and GS Security. It covers the whole working life of an employee — from the moment a position is requested until the person leaves.

The employee journey

Each box is one or more modules. The following chapters explain each one.

Modules

Employee Management

Directory & profile · Onboarding · Offboarding · Requests · Visa & document expiry · Performance · Learning · Expense claims

Hiring Management

Requisitions · Jobs & public careers page · Candidates & interviews · Offers & offer letters · Referrals

Leave & Attendance

Leave requests & balances · Check-in & attendance · Regularisation · Overtime · Payroll output

Administration (shared)

Companies & structure · Roles & permissions · Workflow · Notifications · Reminders · Audit logs · Settings

Reports & Dashboards

Role-based dashboards · 33 reports · Hiring reports · Scheduled reports

Coming later

Payroll · Asset management · Renewal management (placeholders in the frontend today)

Who uses the system

Role	Sees	Typical work
Employee	My Space only	Own profile, leave, attendance, requests, payslips, claims, documents
Team Lead	My Space + Team	Approves direct reports' leave and requests; raises job requisitions; interviews
HR	My Space + Organization + Operations + Reports + Administration	Onboarding, offboarding, visas, hiring, leave operations, approvals
Office Admin	Same as HR	Company structure, files, document expiry, requests (cannot delete)
Super Admin	Everything	Roles & permissions, final approvals, system settings

Any employee can also be an **interviewer** (sees only candidates they interview) and a **referrer** (shares job links and follows their referrals). Candidate people outside the company use only the public careers page and the offer link.

Dubai and Kochi work differently

	Dubai (UAE)	Kochi (India)
Currency	AED	INR
Identity	Passport, Residence visa, Emirates ID, Labour card	Passport, Aadhaar, PAN, UAN (PF)
Bank	IBAN; WPS transfer or bank transfer	Account number + IFSC; bank transfer or cheque
Working hours	09:00 – 18:00, Mon–Fri	09:30 – 18:30, Mon–Fri
Leave types	Annual 30, Sick 90, Hajj, Umrah, …	Casual 12, Earned 15, Sick 12, LOP, …
Visa module	Fully used	Not applicable
Ramadan hours	Yes	No

How to read the diagrams

- **Rounded boxes** are steps; **diamonds** are decisions (yes / no).
- **Box colour shows who does the step:**
  Employee | Team Lead / manager | HR | Admin / Super Admin | Candidate | System (automatic) | Stopped / rejected
- **State diagrams** show the statuses a record moves through, e.g. Pending → Approved.
- Red boxes titled **"Not in the frontend yet"** list behaviour the prototype only shows or does not do. The backend must implement it, or the lead must decide it.

ADMINISTRATION · EVERYONE

1 · Sign-in, roles and access

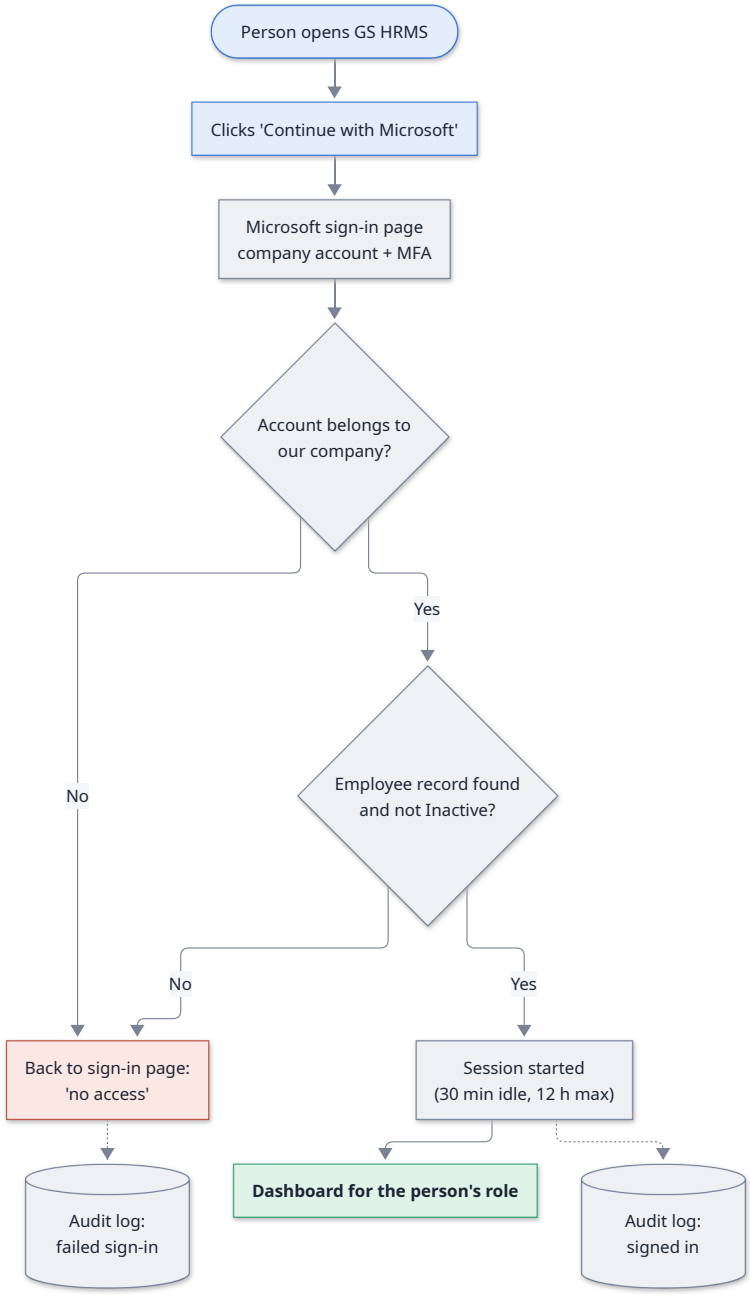

Who can get into the system, and what each person is allowed to see and do once inside.

Used by	Everyone Super Admin manages roles
Frontend	`/login` , `/admin/roles` , `lib/auth.ts` , `lib/access.ts` , `lib/guard.ts` , `lib/nav.ts`
Backend	Phase 0 — sign-in, sessions and the access check are built; Roles & Permissions API is next

In short

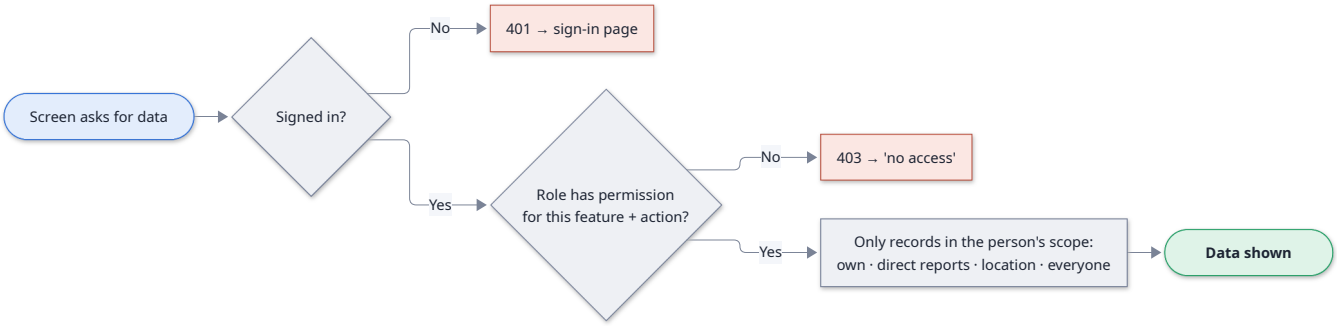

1. Everyone signs in with their **Microsoft 365** work account (with MFA). There are no separate HRMS passwords.
2. Each person has one **role**: Employee, Team Lead, HR, Office Admin or Super Admin.
3. The role decides which **screens** appear and which **actions** (view, add, edit, delete) are allowed.
4. Data is limited to the person's **scope**: own records, direct reports, their location, or everyone.

Signing in

1. Everyone signs in with their **Microsoft 365 work account**. Microsoft checks the password and MFA; GS HRMS never stores passwords.
2. The system looks for the employee record that belongs to that Microsoft account. On the very first sign-in it links them by work email.
3. People who are **Inactive** (left the company) or not in the system cannot get in.
4. The session ends after **30 minutes without activity**, after **12 hours** in total, on sign-out, or immediately when the employee is offboarded.
5. Every sign-in, sign-out and failed attempt is written to the audit log.

Every request is checked

Roles, spaces and permissions

Role	My Space	Team	Organization	Operations / Reports / Admin	Data scope
Employee	✔				Own records
Team Lead	✔	✔			Own + direct reports
HR	✔		✔	✔ (no delete in Administration)	All locations
Office Admin	✔		✔	✔ (never delete)	Own location
Super Admin	✔	✔	✔	✔	Everything

- Permissions are set per **feature** with four actions: **View, Add, Edit, Delete**. Add/Edit/Delete always need View.
- Features are grouped Module → Category → Feature (for example *Administration* → *Organization* → *Companies*).
- Super Admin can create **custom roles**, tick permissions per feature, and add custom features. System roles cannot be renamed.
- "Team" means **direct reports only**, not the whole tree below a manager.

Not in the frontend yet

- Sign-in only checks that the email exists — no password, no Microsoft. The persona switcher changes role freely.
- The permission matrix is shown but never enforced; custom roles disappear on page refresh and cannot be given to anyone.
- The backend now enforces all of this on every request. Next: the Roles & Permissions API and assigning roles to employees.

ADMINISTRATION

2 · Organization setup

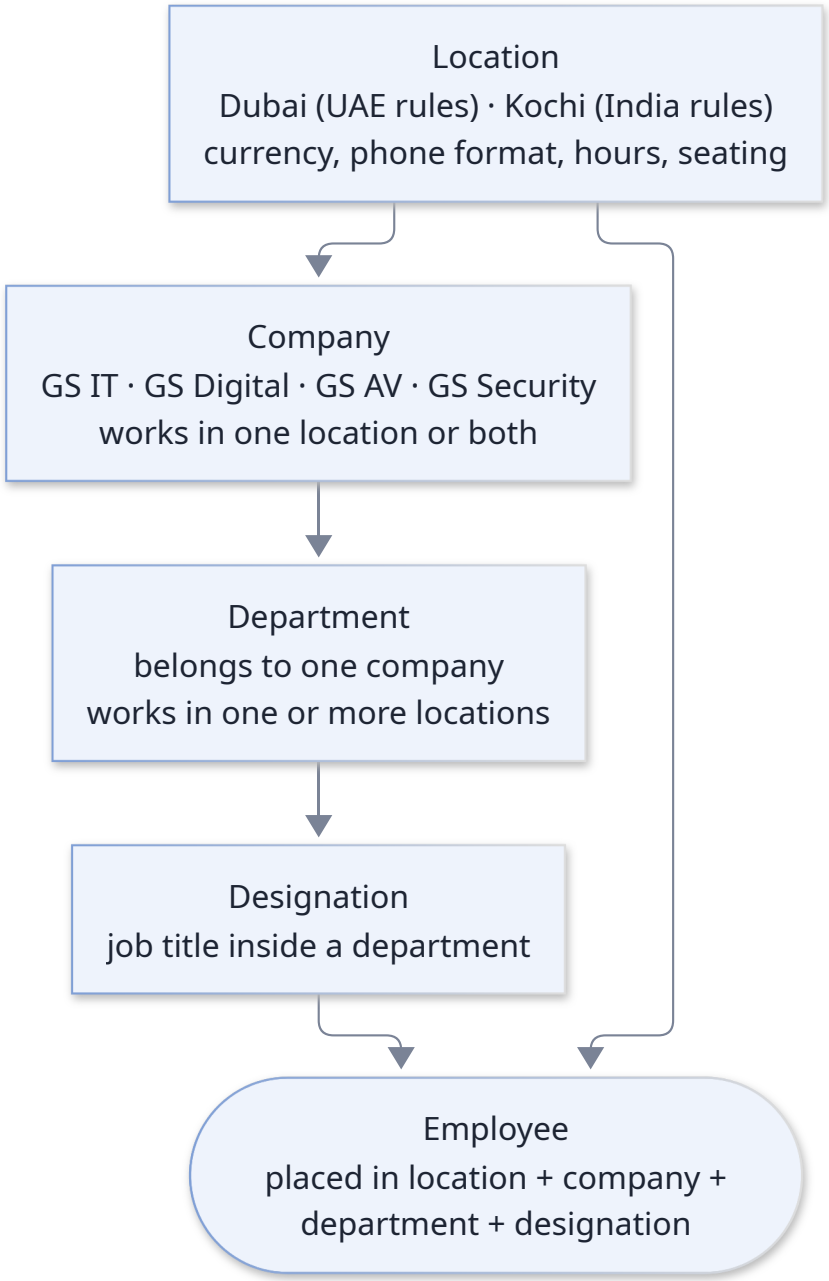

The master data every other module depends on: locations, companies, departments and designations. Set up once, changed rarely.

Used by	Super Admin · HR · Office Admin edit · everyone reads (dropdowns)
Frontend	`/admin/companies` , `/admin/structure` , `/admin/settings` (locations), `context/OrgContext.tsx`
Backend	Phase 0 — Companies API done (reference module); locations, departments, designations next

In short

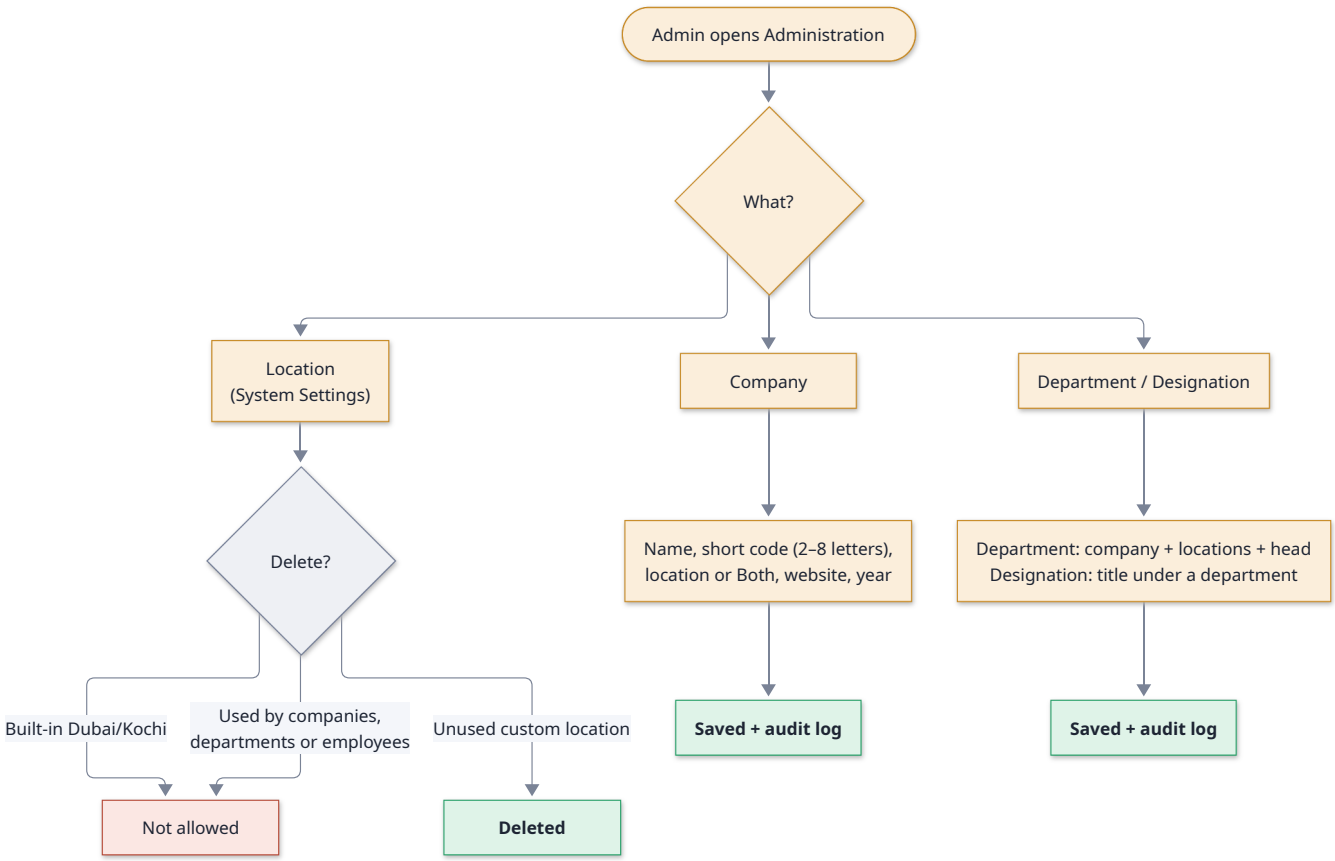

1. **Locations** (Dubai, Kochi) carry the country rules.
2. **Companies** work in one or both locations; **departments** belong to a company; **designations** are job titles in a department.
3. Every employee is placed in a location, company, department and designation.

How the pieces fit

"Sales" can exist in several companies — a department always belongs to exactly one company.

Adding and changing

1. **Locations** decide the country rules: which ID fields an employee has, currency, bank format, holidays and leave types.
2. **Companies** are business units. A company works in Dubai, Kochi or both.
3. **Departments** belong to a company and list the locations they operate in. When an employee is placed, the department must belong to their company *and* operate in their location.
4. **Designations** are the job titles inside a department.
5. Every change is recorded in the audit log (module "Organization").

Not in the frontend yet

- Changes are kept only in the browser and are lost on refresh.
- Removing a company also removes its departments and designations, even if employees still use them. Backend rule: block or deactivate instead of deleting when records are in use.
- Employees store company/department/designation as **names**; the backend uses ids, so renaming is safe.

EMPLOYEE MANAGEMENT

3 · Employee directory and profile

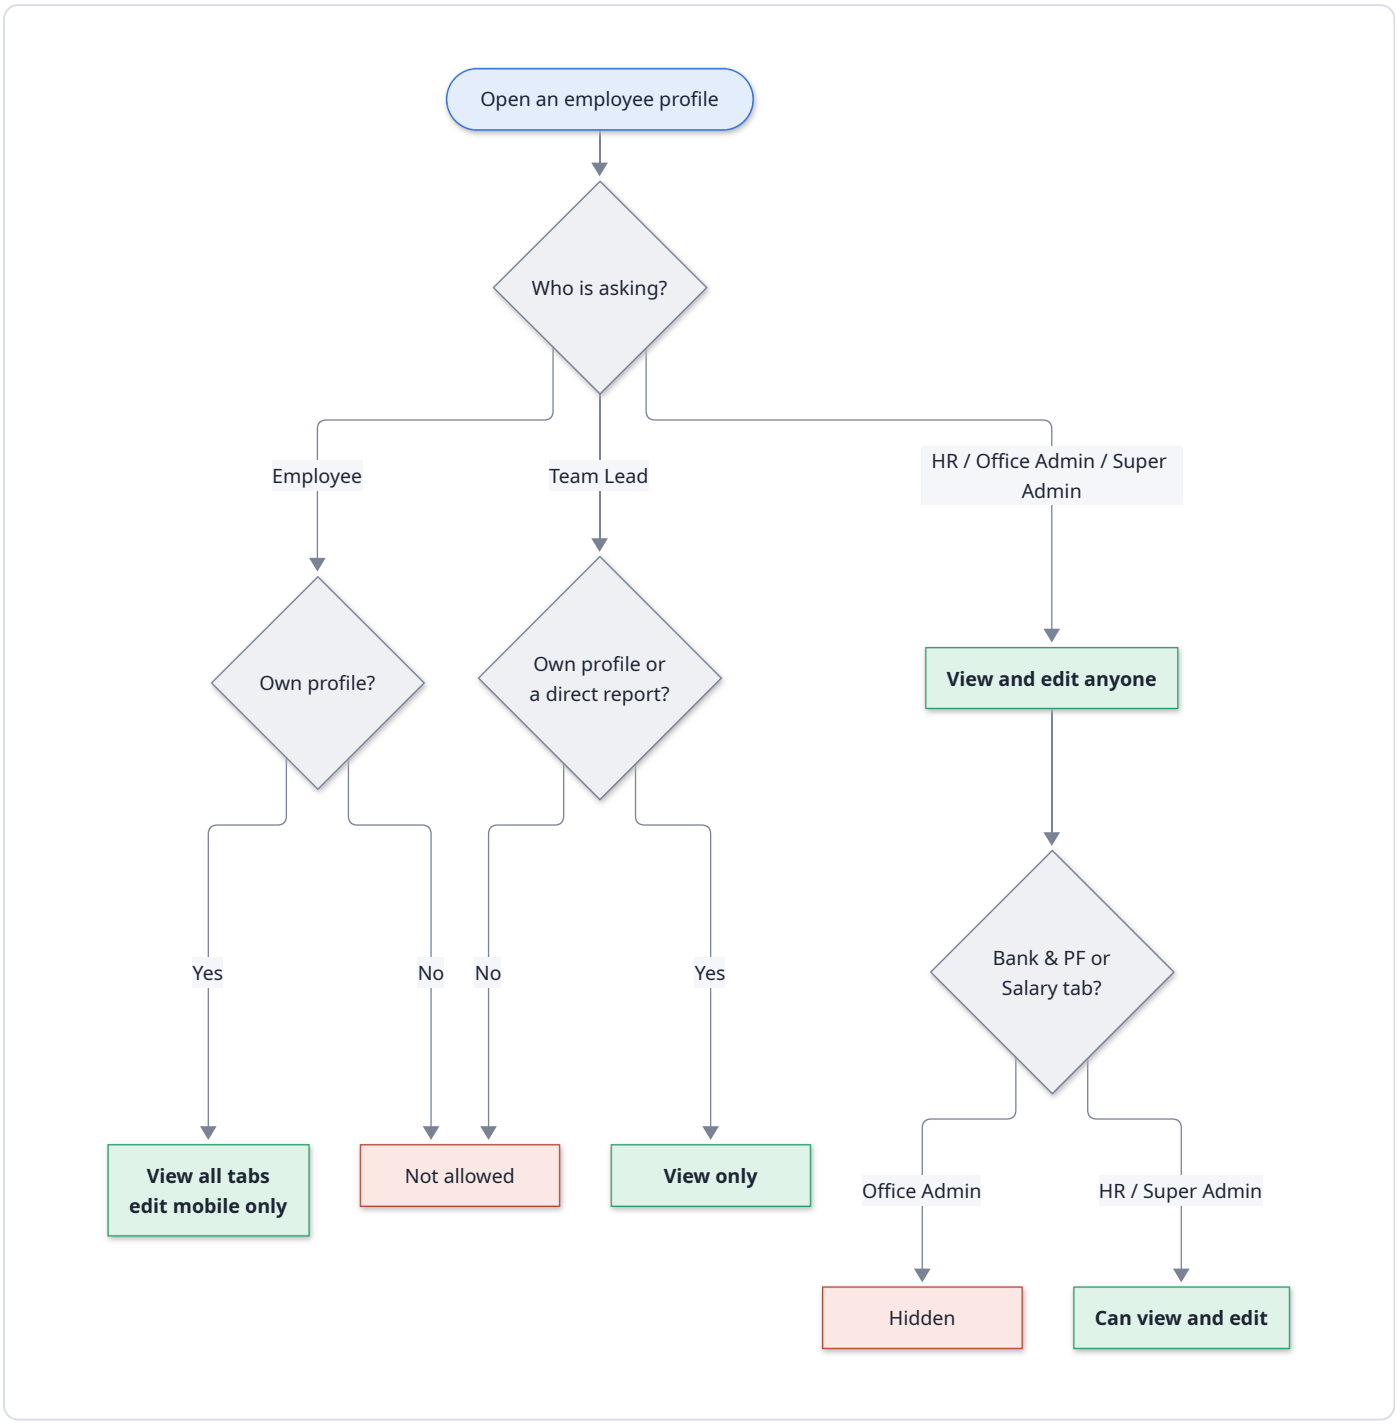

The employee record: who sees it, who can change it, and how changes are tracked.

Used by	Employee own profile · Team Lead direct reports · HR Office Admin Super Admin everyone
Frontend	`/directory`, `/directory/[code]`, `/directory/[code]/edit`, `/profile`, `/org-chart`, `/team/directory`, `/documents`, `lib/employeeStore.ts`
Backend	Phase 1

In short

1. HR, Office Admin and Super Admin see and edit everyone. A Team Lead sees direct reports. An employee sees only themselves.
2. Bank and salary details are visible only to HR and Super Admin.
3. Every change is recorded field by field; employees ask for changes through Requests.

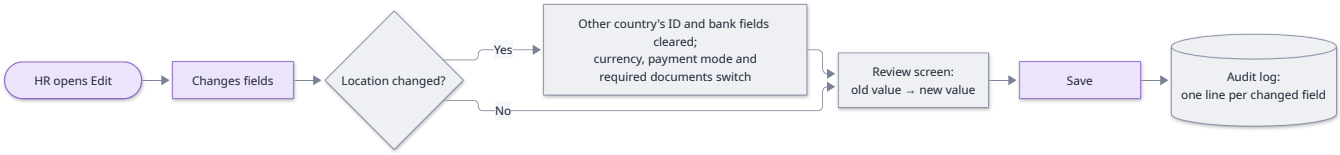

Who can see and change what

What a profile contains

Tab	Contents
Overview / Employment	Code (GS-NNN), name, work email, company, department, designation, location, seating, reporting manager, joining date, status, type (Permanent / Contract / Probation), probation end
Personal	Gender, marital status, blood group, personal email and mobile, addresses, emergency contacts, education, experience, family
Passport / Visa / EID *(Dubai)*	Passport, residence visa, Emirates ID (784-YYYY-NNNNNNN-N), labour card
Passport / Aadhaar / PAN *(Kochi)*	Passport, Aadhaar (12 digits), PAN (ABCDE1234F), UAN (12 digits)
Documents	Uploaded files with expiry dates (PDF, image, Word up to 10 MB)
Bank & Salary	Dubai: IBAN, WPS/bank transfer, Basic + Transport + Accommodation · Kochi: account + IFSC, Basic + HRA + allowances − EPF and other deductions

Editing a profile

- **Never editable directly:** work email, employee code and employment status (status changes only through onboarding and offboarding).
- **Employees** change other personal details through **Requests** (chapter 4).
- **Org chart:** HR can drag a person onto a new manager. The system blocks loops (someone reporting to their own report).
- Identity numbers and bank details are **encrypted** in the backend and shown masked (e.g. ••••••234F) unless the viewer may reveal them.

> **Not in the frontend yet**
>
> - Edits are saved in the browser only; uploaded files are not stored anywhere.
> - The employee's own mobile change is not saved.

EMPLOYEE MANAGEMENT

4 · Employee requests

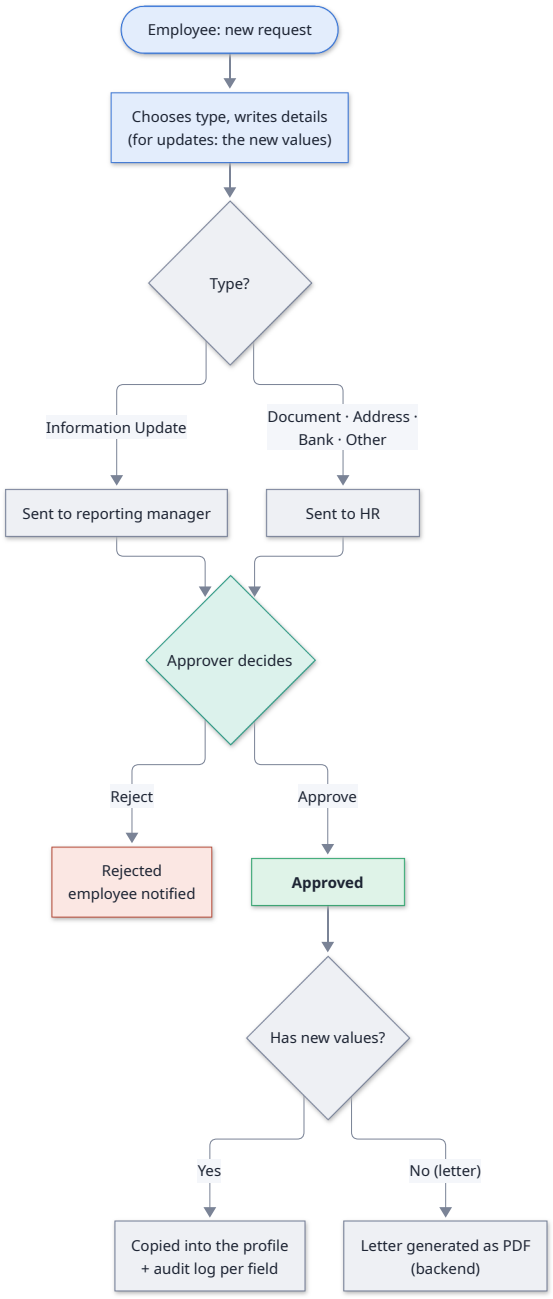

How an employee asks to change their details or asks for a letter, and how it gets approved.

Used by	Employee raises · Team Lead HR Office Admin Super Admin decide
Frontend	`/my/requests` , `/team/requests` , `/requests` , `components/profile/NewRequestDrawer.tsx` , `context/RequestsContext.tsx`
Backend	Phase 1

In short

1. An employee raises a request to change personal details or to get a letter (e.g. salary certificate).
2. Information updates go to the **manager**; everything else goes to **HR**.
3. On approval, the new values are written to the profile automatically and recorded in the audit log.

The flow

Employee: new request
Chooses type, writes details (for updates: the new values)
Type?
Information Update
Document · Address · Bank · Other
Sent to reporting manager
Sent to HR
Approver decides
Reject
Approve
Rejected employee notified
Approved
Has new values?
Yes
No (letter)
Copied into the profile + audit log per field
Letter generated as PDF (backend)

Request types

Type	Goes to	Example
Information Update	Reporting manager	Personal mobile or email, marital status, blood group, gender, nationality, name, date of birth
Document Request	HR	Salary certificate, employment letter, experience letter, NOC, visa support letter, bank letter
Address Change	HR	Current or permanent address
Bank Detail Update	HR	New account / IBAN
Other Request	HR	Anything else

Who can decide

- **Nobody** can decide their own request.
- **HR and Super Admin**: any request.
- **Office Admin**: any request except Bank Detail Update.
- **Team Lead**: only manager-routed requests from their direct reports.

Statuses: **Pending** → **Approved** or **Pending** → **Rejected**. New values are applied **only** when approved.

> **Not in the frontend yet**
>
> - Requested letters are never produced — the backend will generate them as PDFs from templates.
> - Bank detail changes should also notify the employee by email (protection against fraud).

EMPLOYEE MANAGEMENT

5 · Onboarding

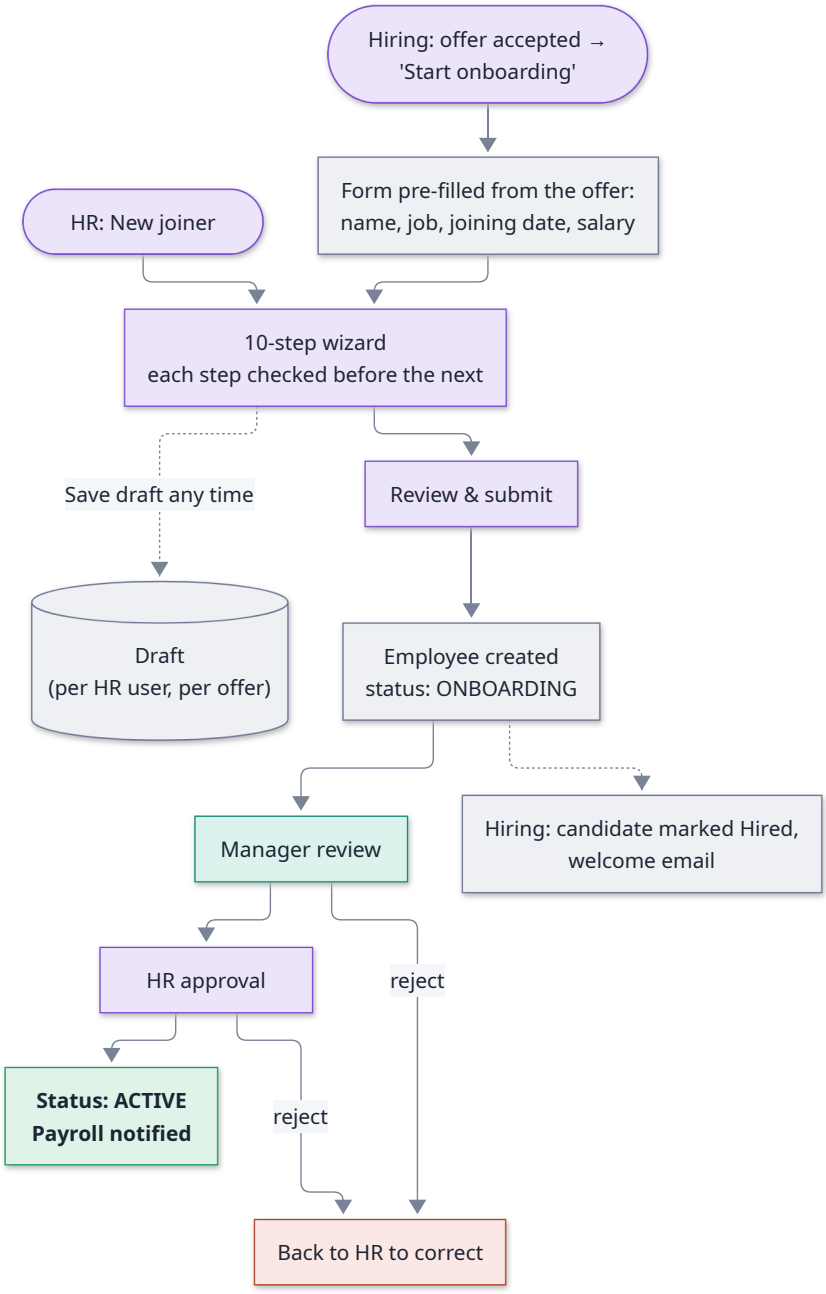

How a new joiner becomes an employee in the system — either typed in by HR or carried over from an accepted job offer.

Used by	HR · Office Admin · Super Admin · approvals by Manager · HR
Frontend	`/onboarding` (10-step wizard), `/onboarding?hire=<offerId>`, `lib/hiringHandoff.ts`, `lib/workflow.ts`
Backend	Phase 1

In short

1. HR fills a **10-step form** for the new joiner — or starts from an **accepted job offer**, which fills most of it.
2. The form can be saved as a draft at any time and finished later.
3. On submit, the employee record is created with status **Onboarding** and goes for approval (manager, then HR).
4. After approval the employee becomes **Active** and payroll is notified.

The flow

Hiring: offer accepted → 'Start onboarding'
Form pre-filled from the offer: name, job, joining date, salary
HR: New joiner
10-step wizard each step checked before the next
Save draft any time
Review & submit
Draft (per HR user, per offer)
Employee created status: ONBOARDING
Manager review
Hiring: candidate marked Hired, welcome email
HR approval
reject
Status: ACTIVE Payroll notified
reject
Back to HR to correct

The 10 steps

#	Step	Dubai	Kochi
1	Personal	Name, gender, date of birth, nationality, contact, addresses	
2	Employment	Company → department → designation (filtered by company and location), manager, joining date, type, system role. Probation ends 6 months after joining. Suggested work email `firstname@gs-it.ae`	
3	Identity	Passport, visa, Emirates ID, labour card	Passport, Aadhaar, PAN
4	Emergency contacts	Local (UAE) + home country	Primary + alternate
5	Experience & education	Previous jobs, qualifications	
6	Family	Name, relationship, occupation	
7	Bank & PF	IBAN (checked), WPS / bank transfer	Account + IFSC, UAN, bank transfer / cheque
8	Salary	Basic, transport, accommodation	Basic, HRA, allowances, EPF and other deductions
9	Documents	Required documents for the country, with expiry dates and reminder settings (90/60/30/7 days; employee, HR, manager)	
10	Assets & approval	Laptop, monitor, phone, access card, SIM, headset, software licence — then submit	

UAE visa tracker (Dubai hires)

While the visa is being processed, HR ticks off **20 stages in 5 groups**: Preparation & documents → Work permit (MOHRE) → Entry permit (GDRFA) → Medical & insurance → Emirates ID & residence.

When the hire comes from Hiring

- Salary lines are matched: Housing → Accommodation, Transport → Transportation. Kochi offers are yearly, so amounts are divided by 12.
- Employment type: Full-time → Permanent, Contract → Contract, Intern → Probation.
- The offer must be **Accepted** and not already used for an employee.

> **Not in the frontend yet — decisions needed**
>
> - Nothing moves a joiner from **Onboarding** to **Active**; the approval chain is only displayed. The lead must confirm the chain.
> - The visa tracker, asset choices and reminder settings live only in the draft and are never saved to the employee.
> - Document uploads in the wizard are placeholders.

EMPLOYEE MANAGEMENT

6 · Offboarding

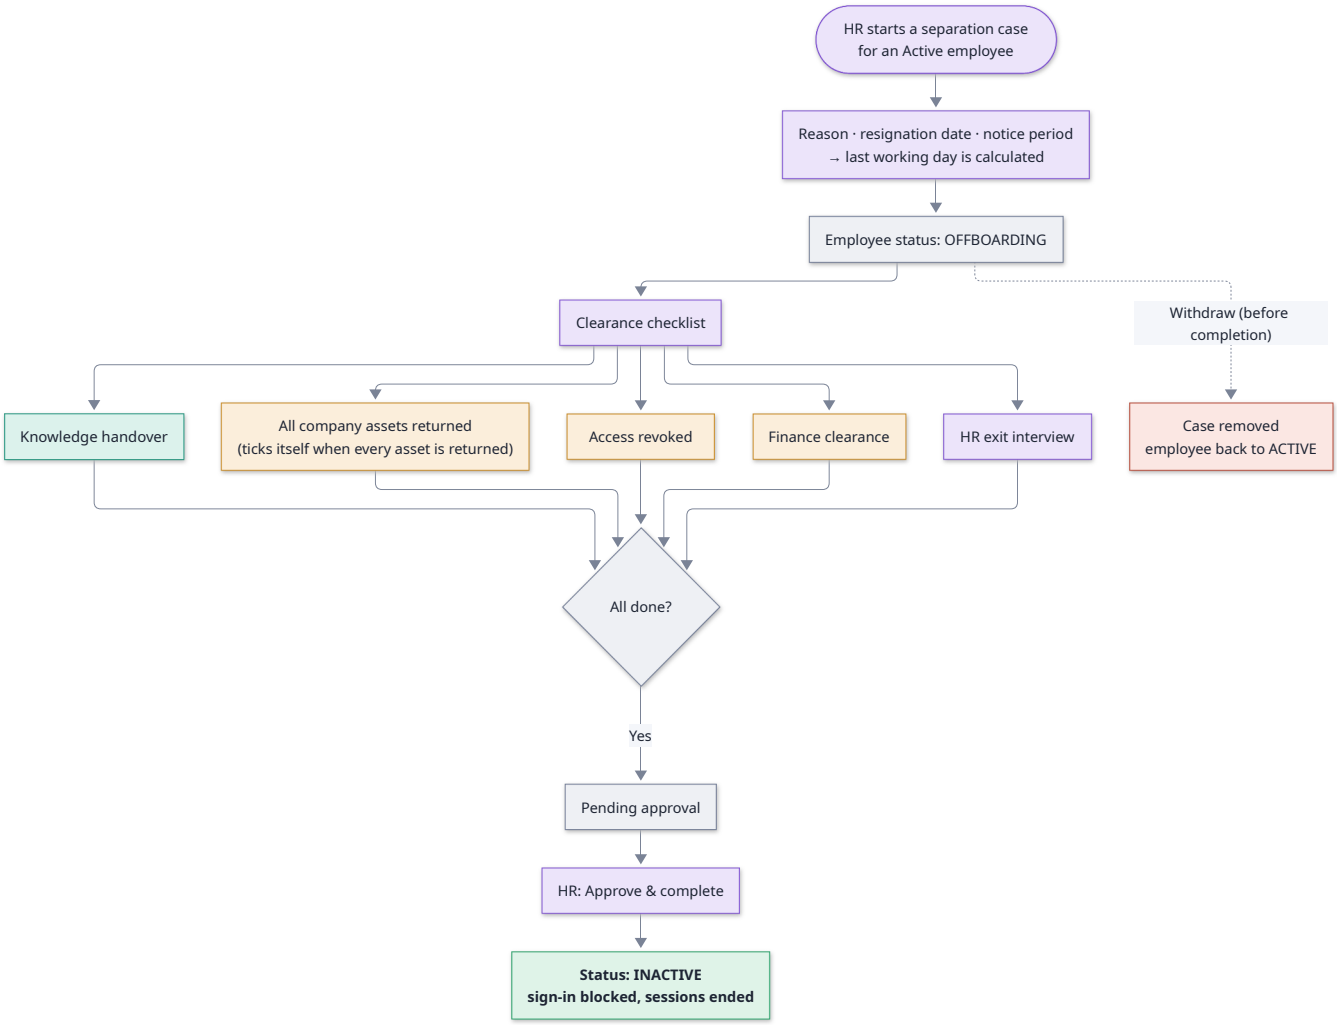

How an employee leaves: a separation case with a clearance checklist, ending with the person becoming Inactive and losing access.

Used by	HR · Office Admin · Super Admin run it · Team Lead views direct reports
Frontend	`/offboarding`, `/team/separation`, `context/SeparationContext.tsx`
Backend	Phase 1

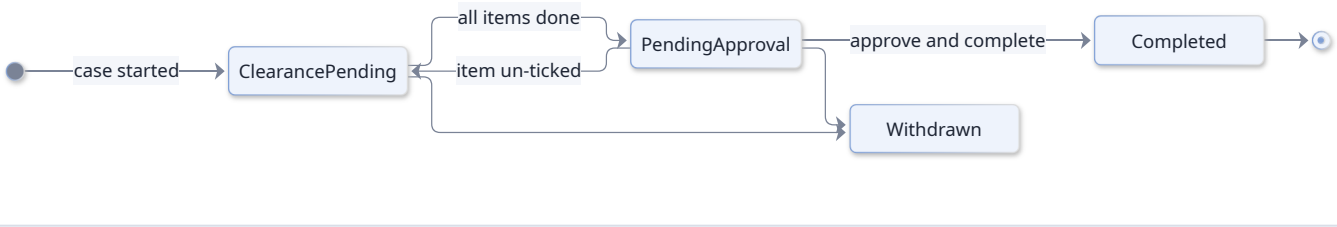

In short

1. HR opens a **separation case** with the reason and notice period; the last working day is calculated.
2. Five clearance items are completed: handover, assets returned, access revoked, finance, exit interview.
3. HR approves and completes the case — the person becomes **Inactive** and can no longer sign in.

The flow

Statuses

Rules

- Reasons: Resignation, Termination, End of contract, Retirement, Other.
- Notice: 0, 15, 30, 60 or 90 days. Last working day = resignation date + notice (HR can override).
- Only **Active** employees without an open case can be offboarded.
- A **Team Lead** can see their direct reports' cases but cannot change them.
- The separation register can be exported to CSV.

Not in the frontend yet — decisions needed

- **No self-service resignation.** Only HR can start a case. Expected chain (from Workflow Settings): Resignation logged → Manager / IT / Finance clearance → HR final approval — confirm with the lead.
- Cases are lost on page refresh; the employee's sessions are not ended (the backend now does this).

7 · Visa and document expiry

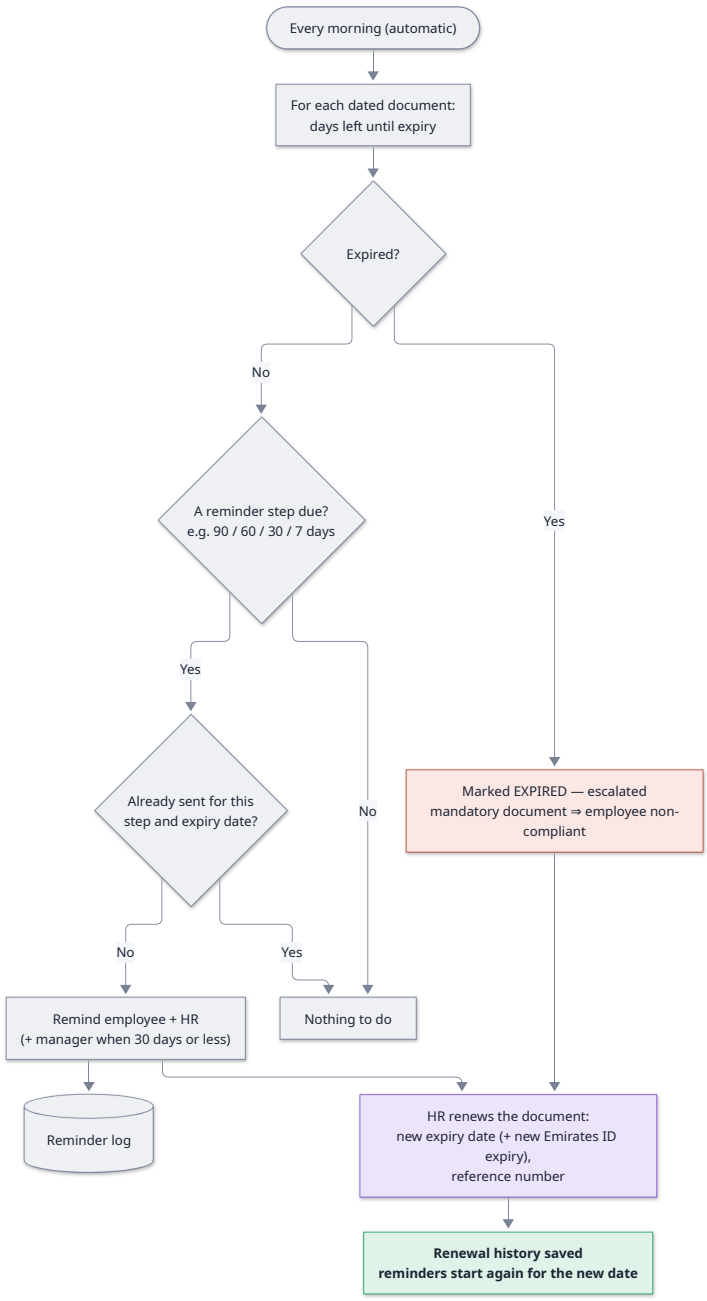

Keeps every dated document (visa, Emirates ID, passport, labour card, licences…) valid, by reminding the right people before it expires and recording each renewal.

Used by	HR Office Admin register and renewals · Employee own documents · Team Lead team view
Frontend	`/visa` , `/team/visa` , `/employee-expiry` , `/my/expiry` , `/team/expiry` , `/admin/reminders` , `lib/reminderRules.ts` , `lib/expiryRegister.ts`
Backend	Phase 1 (daily reminder job)

In short

1. Every dated document has an expiry date and a reminder schedule (for example 90, 60, 30 and 7 days before).
2. Each day the system sends the reminders that are due — once per step — to the employee and HR, and to the manager near the end.
3. When the document is renewed, HR enters the new expiry date and the reminders start again.

Daily reminder check

Reminder schedules

Documents	Remind (days before)	Default
Residence visa, Emirates ID, work permit	90 · 60 · 30 · 7	On
Passport	90 · 30	On
Labour card	60 · 30 · 7	On
Trade and professional licence	90 · 60 · 30	On
Employment contract	60 · 30	Off
Other dated documents (insurance, driving licence…)	60 · 30 · 7	On

Rules

- **Status:** OK · Expiring soon (90 days or less) · Expired.
- **Mandatory** for compliance: residence visa, Emirates ID, labour card, passport.
- The visa register covers **Dubai only** and excludes inactive employees; Kochi shows "not applicable".
- A renewal must have a new expiry date in the future and later than the current one.
- A dated document only counts as valid when its file is uploaded.
- HR can also send a reminder manually; it always includes the manager.

> **Not in the frontend yet**
>
> - Reminders are only listed on screen — no email is sent and nothing runs automatically.
> - Admins can switch schedules on/off but cannot change the days or recipients yet.

HIRING MANAGEMENT

8 · Hiring

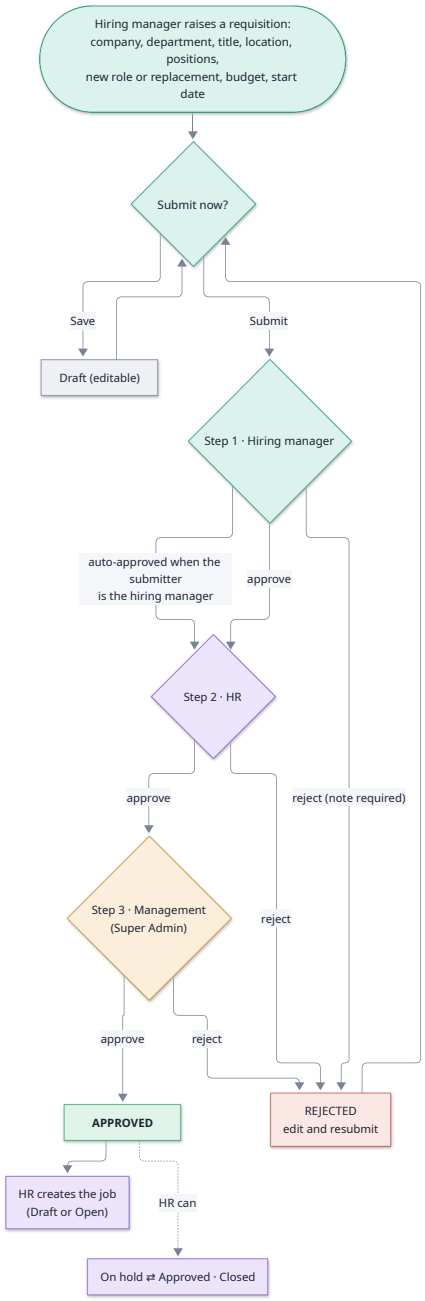

From "we need a person" to "the person joined": requisition approval, job posting, candidate pipeline, interviews, offer letter, and the hand-over to onboarding.

Used by	Team Lead as hiring manager · HR Office Admin Super Admin run hiring · Any employee interviews, refers · Candidate
Frontend	`/hiring/*` (dashboard, requisitions, jobs, candidates, interviews, offers, operations, reports), `/careers`, `/offer/respond/[token]`, `/my/interviews`, `/my/referrals`, `lib/hiringStore.ts`
Backend	Phase 2 — in progress, step by step

In short

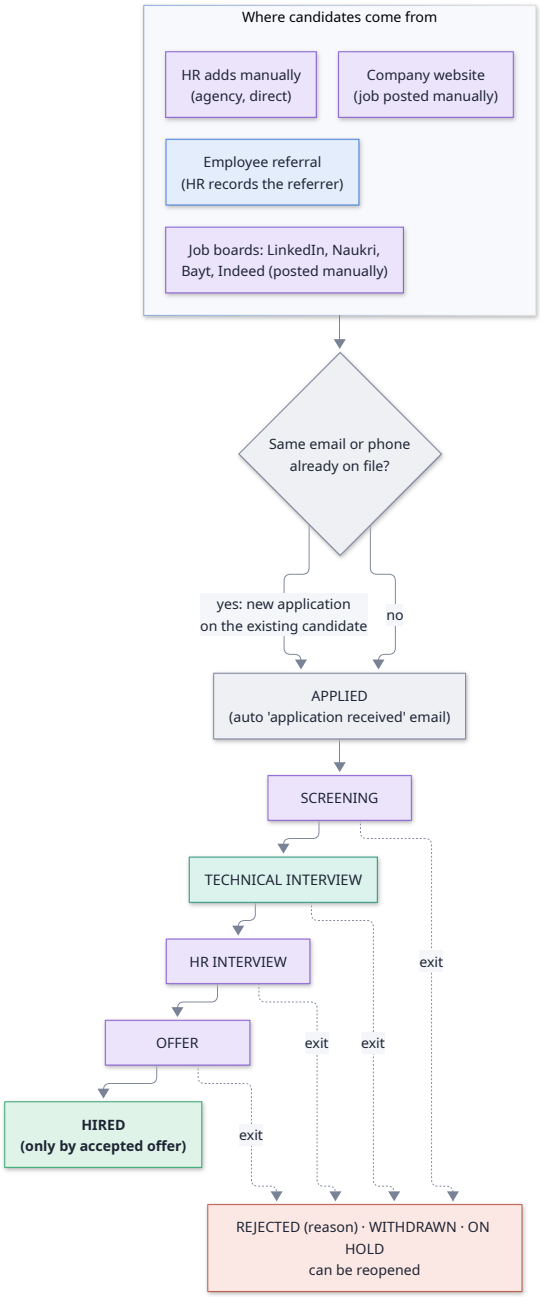

1. A **hiring manager** asks for a position (requisition). It is approved by the hiring manager, HR and management.
2. **HR** turns the approved requisition into a **job** and publishes it on the careers page and job boards. Employees can share a referral link.
3. Candidates move through **Applied** → **Screening** → **Technical** → **HR interview** → **Offer**. Interviews are scheduled with a panel.
4. HR sends an **offer letter** as a private link. The candidate accepts by typing their name, or declines with a reason.
5. An accepted offer becomes a **Hired** candidate, and HR starts **onboarding** with the form already filled.

A · Requisition — asking for a position

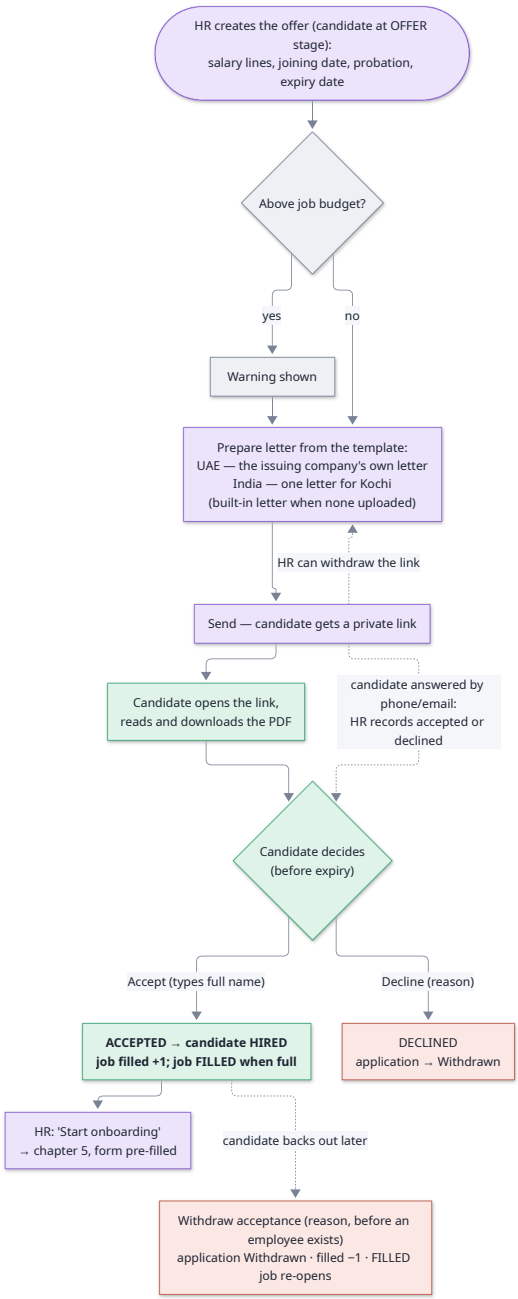

- **Nobody approves their own requisition:** whoever raised it cannot decide its steps. Two exceptions: the hiring manager decides their own step (automatically when they submit it themselves), and a Super Admin confirms the Management step of their own requisition once the hiring manager and HR have approved.
- The HR step is decided by HR or Office Admin; the Management step by a Super Admin, who may also decide any other step.

B · Job and candidate pipeline

- **Interviews:** round (Screening, Technical, HR, Final), date, time, duration, mode (In-person, Teams, Phone) and panel. The system warns when a panel member already has an interview at that time. Scheduling moves the candidate forward to that stage. Interviews can be rescheduled, completed or cancelled.
- **Emails** per stage are either sent automatically, offered to HR ("ask"), or off. Template fields such as candidate name, job title and interview time are filled in automatically.
- **Job status:** Draft → Open ⇄ On hold → Closed; a closed job can be reopened while positions are left to fill. **Filled** is set automatically when the last position is filled. Every change, and every recruiter change, is kept in the job's History tab. A job cannot be edited after it is created (frontend).
- No candidate can be moved while the job is **Closed** or **Filled**.

C · Offer and hand-over

- **Offer letters:** in the UAE every company (GS IT, GS Digital, GS AV, GS Security) has its own letter template; India has one. The letter's company name and footer follow the company that issues the offer (taken from the job). HR uploads a .docx/.html file or edits the text; letters already prepared keep their text.
- **Recruiter:** every job has a recruiter who runs it. HR can change the recruiter; the new recruiter is notified and the change is kept in the job's history.

Who can do what

Who	Can
HR, Super Admin	Everything: requisitions, jobs, all candidates, offers, email templates, offer-letter templates, reports
Team Lead, Office Admin	Raise a requisition (request for a position) and follow it; a Team Lead approves the Hiring Manager step of requisitions they manage and sees salary on their jobs
Any employee	Interviews they are on (`/my/interviews`); referral links for referral-eligible jobs and their referrals' progress
Candidate	Careers page and their own offer link only — no account

Kochi offers show the India breakup automatically: EPF 12% of Basic (capped at INR 1,800), Kerala professional tax, employer PF and gratuity.

Not in the frontend yet — decisions needed

- **Nothing is public** (decided 22 Oct 2026): no careers page or online apply. HR posts jobs on the website and job boards by hand and adds applicants to the HRMS. The prototype's public careers pages and share links must be removed. **Later:** push jobs to the website, job boards and social media, and pull applications back.
- Should the candidate's **offer letter link** also go (HR emails the PDF and records the answer)?
- No **interview feedback or scorecards** — only free notes.
- No **offer approval** (even over budget) and offers never expire automatically.
- CVs are not stored (only the file name); emails are never really sent; Outlook/Teams are switches only.
- Offer PDF is built in the browser as an image — the backend will produce the official PDF.
- Access follows the Roles & Permissions matrix (decided 22 Oct 2026). The prototype's hiring screens still give Office Admin full access and Team Leads their jobs' pipeline — the frontend must be aligned.
- Rejecting or withdrawing a candidate does not withdraw an offer already sent — the candidate could still accept.
- Requisition and job status changes, and HR "record accepted", have no checks in the prototype — the backend enforces the transitions shown above.

LEAVE & ATTENDANCE

9 · Leave

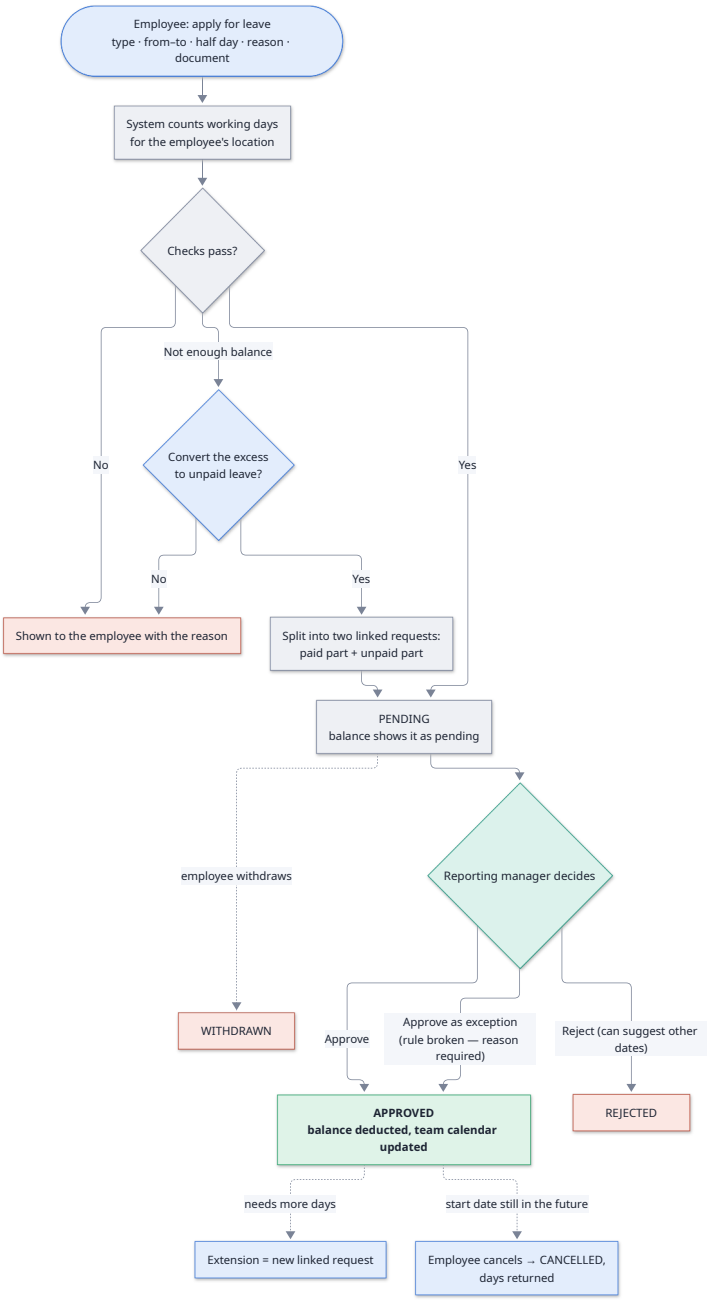

How an employee applies for leave, how the system checks it, who approves it, and how balances change.

Used by	Employee applies · Reporting manager approves · HR operations (types, holidays, adjustments)
Frontend	`/my/leave-attendance`, `/team/leave`, `/modules/leave-attendance/*` (full Leave & Attendance app in `public/la/*.js`), `lib/leaveBridge.ts`
Backend	Phase 3 — needs the lead's decision on the correct leave entitlements (see last box)

In short

1. The employee picks a leave type and dates. The system counts **working days** only (weekends and public holidays are skipped).
2. The system checks balance, overlaps, notice, documents and eligibility before the request is accepted.
3. The request goes to the **reporting manager**. If there is none, it goes up the chain: manager's manager → HR → Super Admin.
4. Approved leave is deducted from the balance. Pending leave is shown as "pending" and reserved.

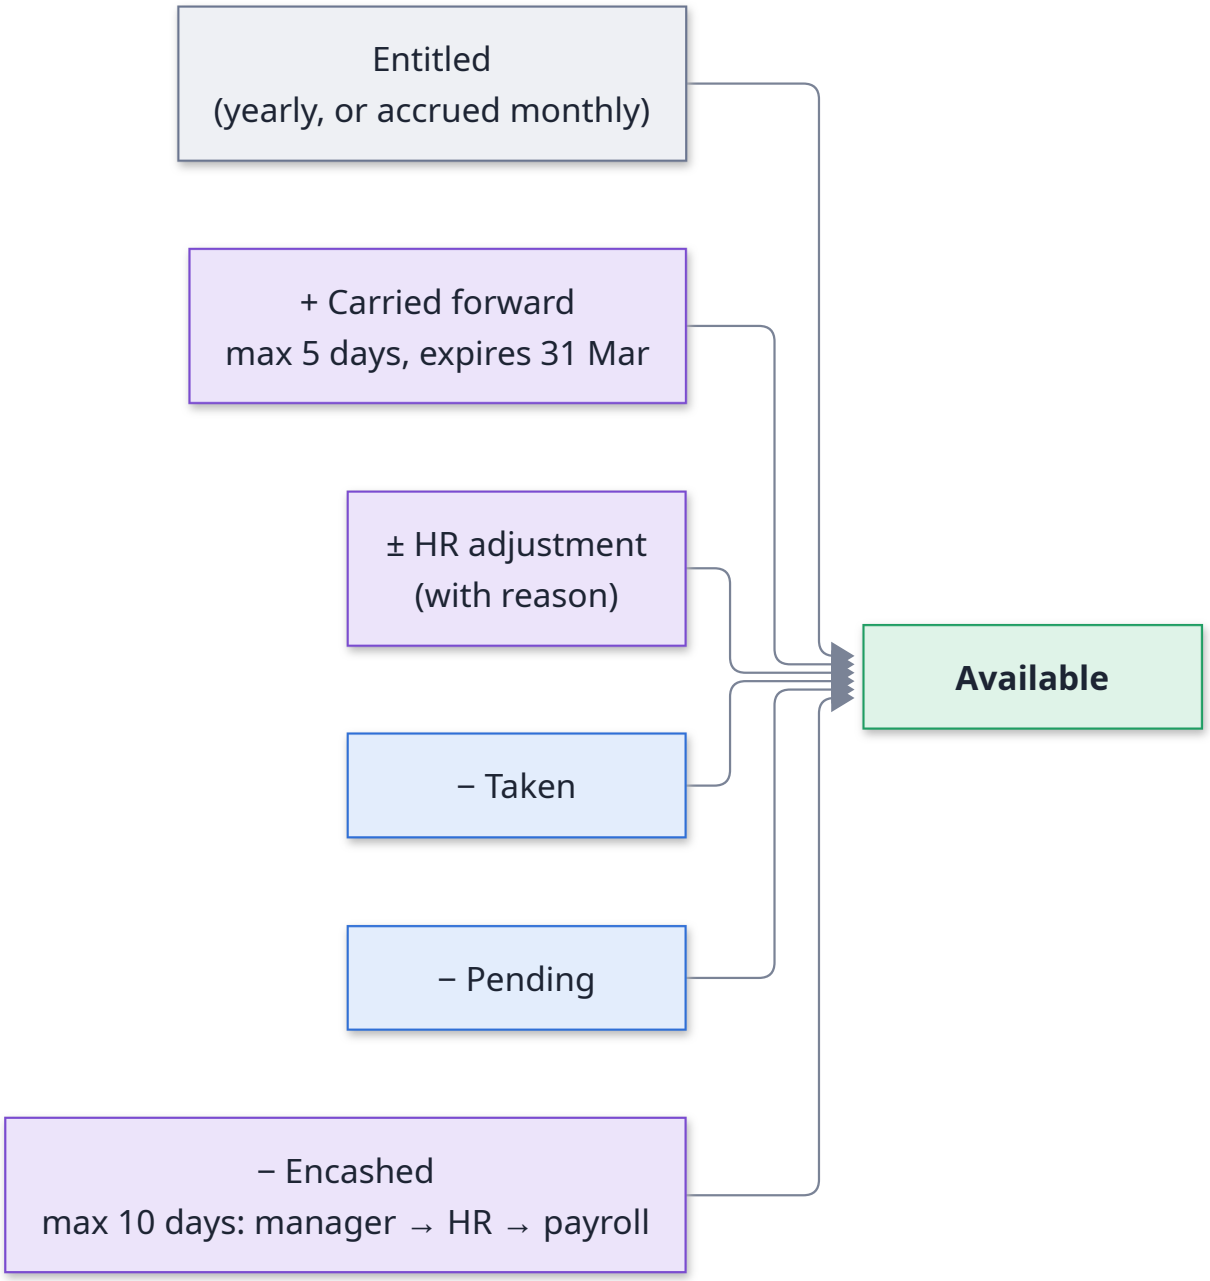

Applying and approving

What the system checks

- Not more than **30 days in the past**; no overlap with other pending or approved leave.
- **Notice:** Annual leave 30 days ahead, Earned leave 7 days ahead (warning only).
- **Sick leave certificate:** Dubai — 2 days or more, or a Monday; Kochi — more than 2 days.
- **Eligibility:** maternity (female), paternity/parental, Hajj once per service after 1 year, Umrah once a year, marriage leave once, study leave after 2 years. Restricted festive leave is exactly 1 day.
- **Annual leave plan:** at most 3 blocks a year, each at least 7 days, at least 90 days apart.
- The approver is never the requester, and never someone who reports to the requester.

Balances

Leave types

Dubai (UAE)	Kochi (India)
Annual 30 days (2.5 a month) · Sick 90 (15 full pay, 30 half, 45 unpaid) · Compassionate · Maternity (45 full + 15 half) · Parental · Hajj · Umrah · Study · Restricted festive · Casual · Unpaid	Casual 12 (1 a month) · Earned 15 (1.25 a month) · Sick 12 · Maternity 26 weeks · Paternity · Marriage · Bereavement · Loss of pay (LOP)
Both: Compensatory off (earned from overtime) and Work from home are requested the same way.	

Not in the frontend yet — decisions needed

- The frontend has **two leave systems** that disagree: the main app says Annual 21 / Sick 10 / Casual 7, the Leave & Attendance app says Annual 30 / Sick 90 (Dubai). The lead must confirm the correct numbers.
- Monthly accrual is described but not calculated. Multi-step approval chains (e.g. unpaid leave → HR) are shown as text only.
- The backend keeps **one** balance, built from a history of every change (accrual, taken, adjustment, carry-forward, encashment).

10 · Attendance, overtime and payroll output

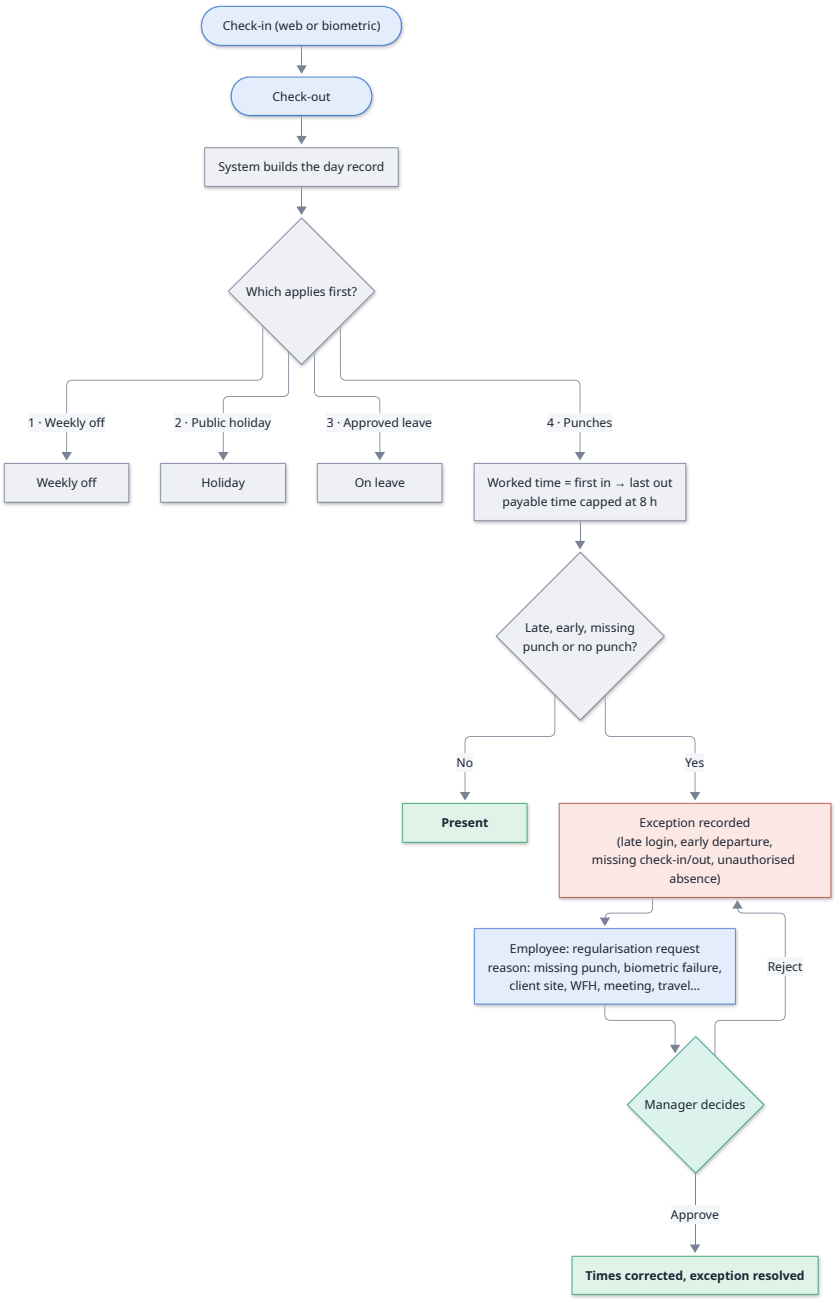

How daily attendance is recorded and corrected, how overtime is claimed, and how HR closes the month for payroll.

Used by	Employee checks in, requests corrections · Manager approves · HR processes and locks the month · Super Admin devices & integrations
Frontend	`/my/leave-attendance`, `/team/attendance`, `/modules/leave-attendance/*` (`public/la/la-att.js`, `la-ops1.js`, `la-ops2.js`)
Backend	Phase 3 — needs the biometric device decision

In short

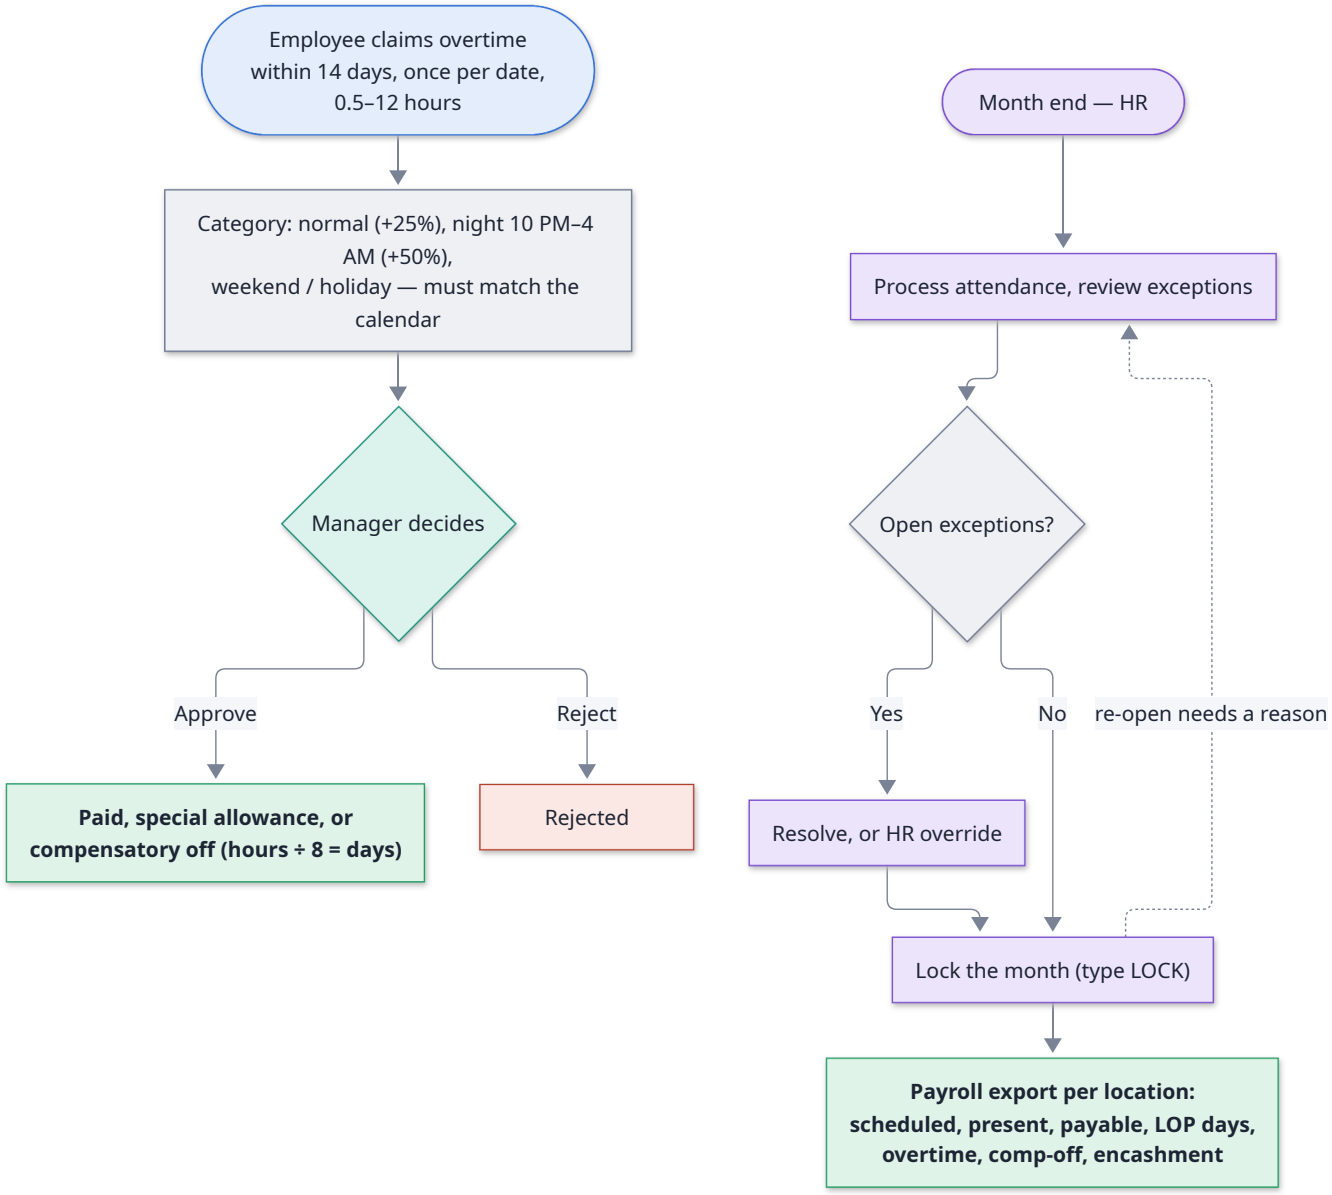

1. Employees check in and out on the web or on a biometric device.
2. Each day the system works out a status: present, late, half day, on leave, holiday, weekly off, missing punch, absent…
3. Mistakes are fixed with a **regularisation request** approved by the manager.
4. At month end HR resolves exceptions, **locks** the month and exports the figures for payroll.

A normal day

- **Planned** late login, early departure or shift change can be requested in advance (today or later) and then do not count against the employee.
- Regularisation: not for future dates or weekly offs; one per date. HR can also correct times directly (reason + attachment required).
- **Ramadan** (Dubai): reduced working hours for the configured period.

Overtime and month end

Occurrences and discipline

Repeated late logins or early departures count as **occurrences**: 2 → verbal warning, 3 → first written, 6 → second written, 8 → final, 10 → termination review. Unauthorised absence escalates faster (1, 2, 3, 4). The system only **recommends**; HR confirms every outcome.

Not in the frontend yet

- Past attendance is generated as sample data; nothing is really recorded. No biometric device is connected.
- Approval chains for unpaid leave and overtime are described but each approval is a single step today.

EMPLOYEE MANAGEMENT

11 · Expense claims

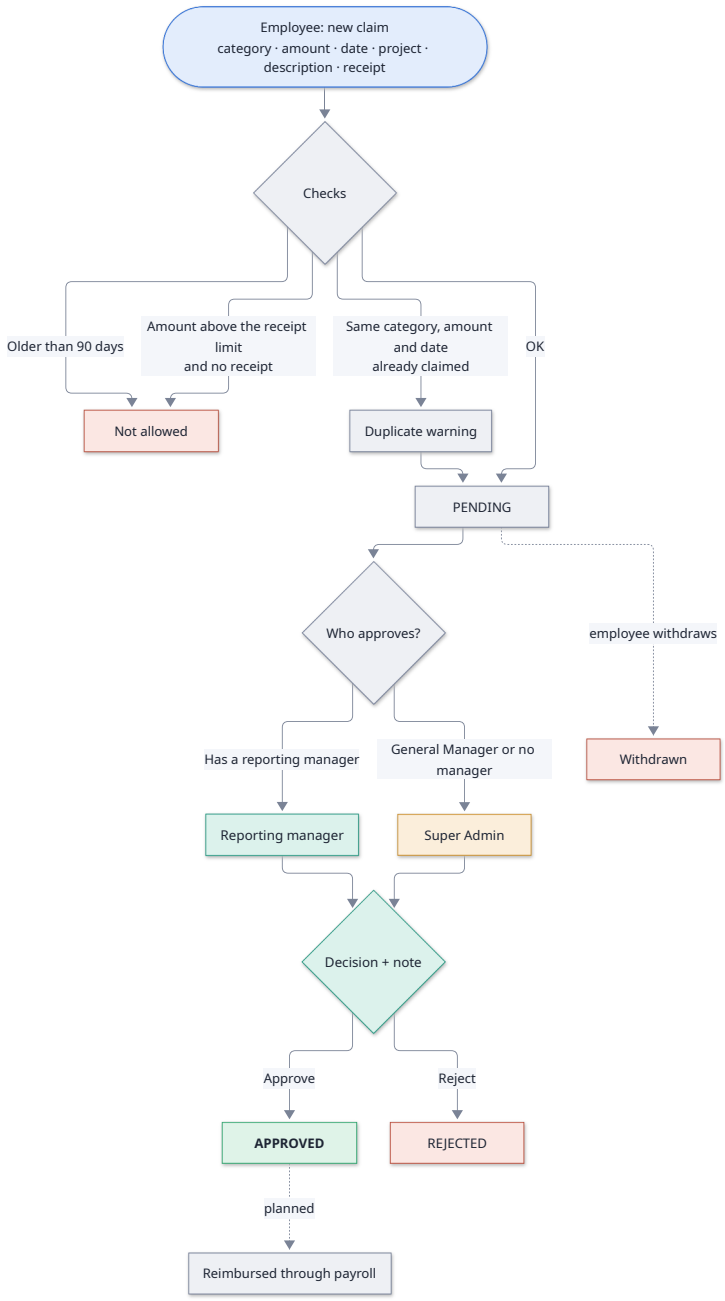

How an employee claims money spent for work, and how it is approved.

Used by	Employee claims · Manager approves · HR Office Admin categories and dashboard · Super Admin senior claims
Frontend	`/expense/new`, `/expense/claims`, `/expense/approvals`, `/expense/dashboard`, `/expense/categories`, `context/ExpenseContext.tsx`
Backend	Phase 4

In short

1. The employee enters category, amount, date, project, description and attaches a receipt.
2. The claim goes to their **reporting manager** (the General Manager's claims go to Super Admin).
3. The approver approves or rejects with a note. The employee can withdraw while it is pending.

The flow

Rules

- **Categories** (managed by HR/Admin) have a limit per currency (AED for Dubai, INR for Kochi) and can be switched off.
- **Receipt required** when the amount is above the category limit or above 200 AED / 2,000 INR, whichever is lower.
- Totals on the dashboard are kept **per currency** — AED and INR are never added together.
- HR and Admin can file a claim on behalf of someone else.

Not in the frontend yet — decisions needed

- The screen says over-limit claims need an **extra management approval**, but it is not implemented. Confirm the rule.
- Withdrawing deletes the claim; the backend keeps it with status Withdrawn (for audit).
- Receipts are not stored; reimbursement is not linked to payroll.

12 · Performance and learning

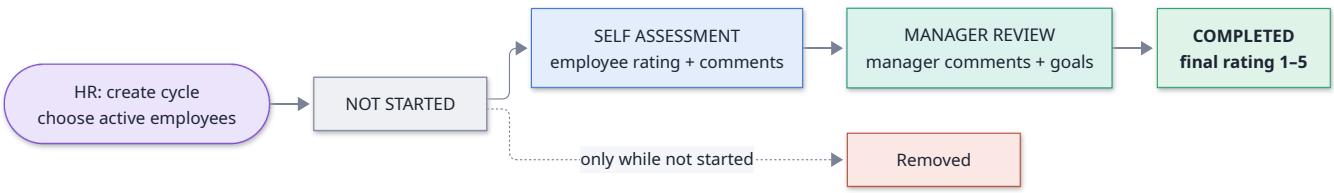

Review cycles with self-assessment and manager rating, and training assigned to employees.

Used by	HR creates cycles and assigns courses · Employee self-assessment, training · Team Lead reviews direct reports
Frontend	`/performance`, `/learning`, `context/PerformanceContext.tsx`, `context/LearningContext.tsx`
Backend	Phase 4

In short

1. HR starts a **review cycle** (e.g. "H1 2026") for chosen employees.
2. The employee rates themselves and comments; the manager adds comments and the final rating (1–5).
3. HR **assigns courses** with a due date; employees start and complete them, with a score.

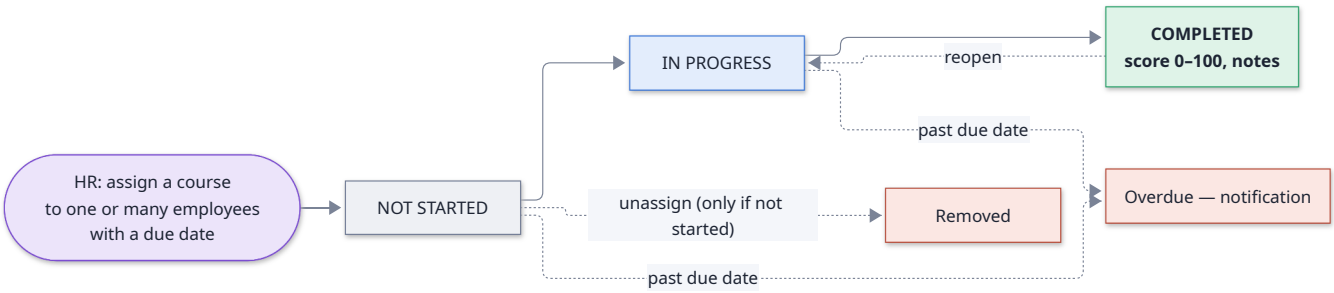

Performance review

Rating	1	2	3	4	5
Meaning	Needs improvement	Below expectations	Meets expectations	Exceeds expectations	Outstanding

- An employee gets only one review per cycle (duplicates are skipped).
- A Team Lead sees and reviews direct reports only. Reviews due within 7 days or overdue raise a notification.

Learning

Course categories: Compliance, Sales, Management, Finance, Culture, Technical, Safety, Soft Skills (HR can add more); the same course is never assigned twice to the same person.

Not in the frontend yet

- There is no real "cycle" or "course catalogue" — both are just text on each record. The backend adds proper tables.
- Goals are free text; no KPIs, 360° feedback or calibration yet. The 11 performance reports in the Reports module expect more data than exists.

ADMINISTRATION · SHARED BY EVERY MODULE

13 · Notifications, workflow and audit

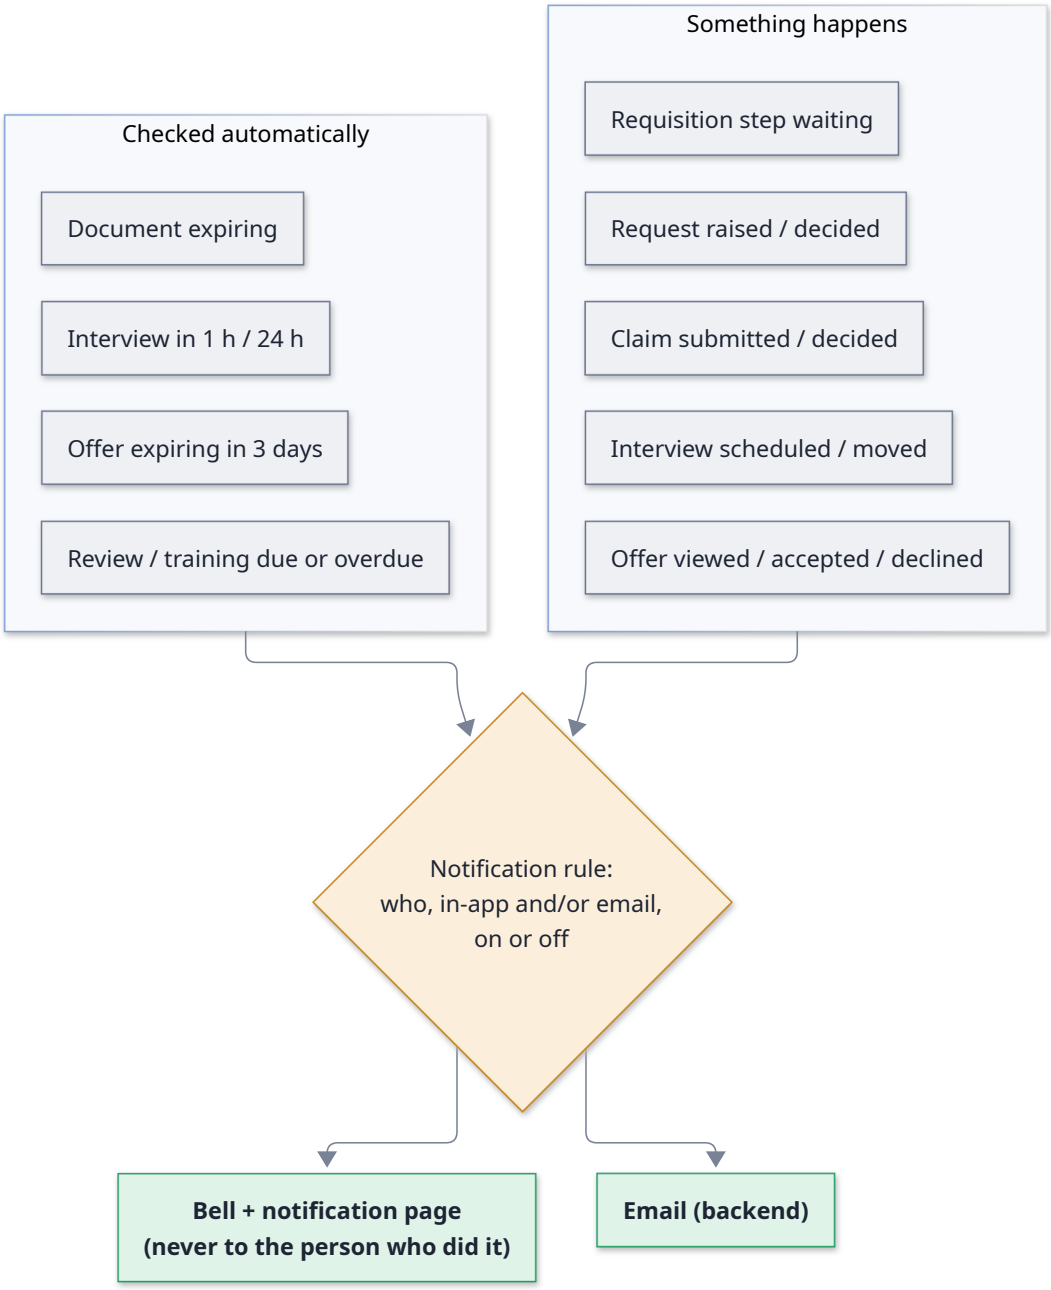

The shared machinery: who gets told about what, who approves what, and the permanent record of every change.

Used by	Everyone receives notifications · Super Admin HR configure rules and read the audit log
Frontend	`/my/notifications` , `/team/notifications` , bell in the top bar, `/admin/workflow` , `/admin/notifications` , `/admin/reminders` , `/admin/audit`
Backend	Phase 0 — audit log built; workflow engine and notifications next

In short

1. When something happens (a request is raised, an offer is accepted…), the right people get a **notification**.
2. Some notifications are **time-based** (a document expiring, an interview in one hour) and are checked automatically.
3. All approvals follow **workflow chains** that admins can see (and, in the backend, change).
4. Every change is written to the **audit log**, which can never be edited or deleted.

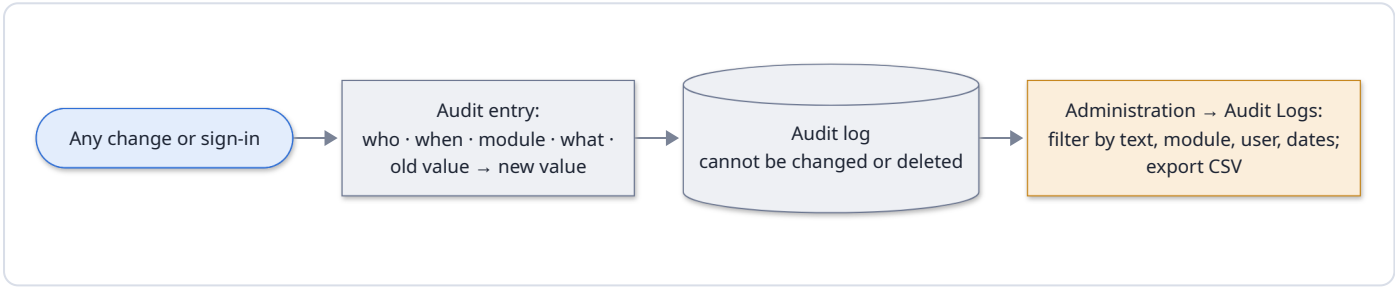

Notifications

Approval workflows

Process	Approval chain
Job requisition	Hiring manager → HR → Management (Super Admin)
Onboarding	HR initiates → Manager review → HR approval → Payroll notified
Offboarding	Resignation logged → Manager / IT / Finance clearance → HR final approval
Employee request	Information update → manager; other types → HR
Leave	Reporting manager (fallback: manager's manager → HR → Super Admin)
Expense claim	Reporting manager (General Manager → Super Admin)
Leave encashment	Manager → HR → payroll

Audit log

Recorded modules include Security (sign-ins, exports), Employee, Bank, Salary, Organization, Access (roles and permissions), Approvals, Requests, Expense, Hiring, Leave & Attendance, Documents, Performance and Learning.

Not in the frontend yet

- Notification rules and workflow switches are only displayed — nothing reads them. No email is ever sent.
- Approval chains cannot be changed. The backend adds one shared workflow engine that admins can configure.
- The frontend audit log lives in the browser; the backend version is permanent and protected by the database.

REPORTS

14 · Dashboards and reports

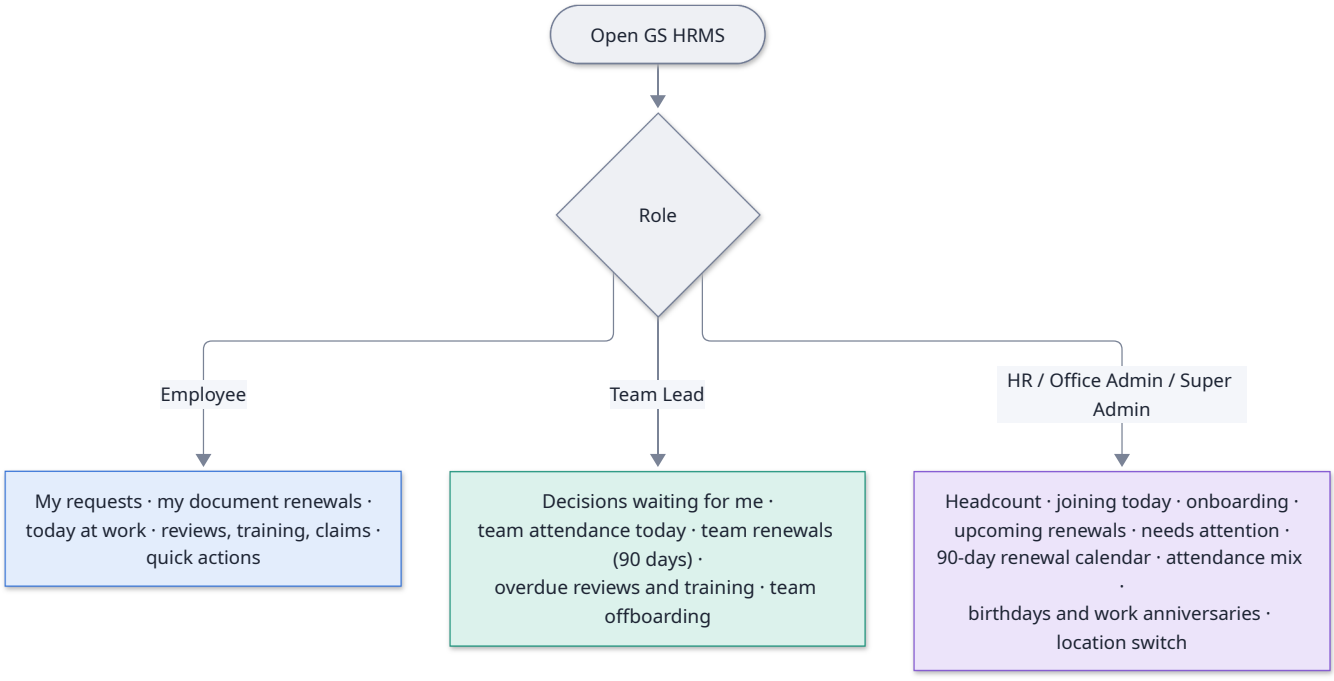

What each role sees when they open the system, and the reports HR and management can run and export.

Used by	Everyone dashboard · HR Office Admin Super Admin reports
Frontend	`/dashboard` , `/reports` , `/hiring/dashboard` , `/hiring/reports` , `lib/reportEngine.ts`
Backend	Phase 4

In short

1. The dashboard is **different for each role** and shows what needs attention today.
2. There are **33 reports** in four groups plus hiring reports, filtered by location and exported to CSV.
3. Reports can be **scheduled** to arrive by email daily, weekly or monthly.

Dashboard by role

Reports

Employee (7)

Dashboard, headcount, additions, attrition, distribution, diversity, exits by tenure

Leave (8)

Daily, availability, balance, booked, by type, encashment, loss of pay, payroll

Attendance (7)

Daily, early/late punches, presence, hours, payroll, muster roll, consecutive absences

Performance (11)

Goals, skills, feedback, status, rating, score, nine-box, appraisal feedback, history, summary, extension

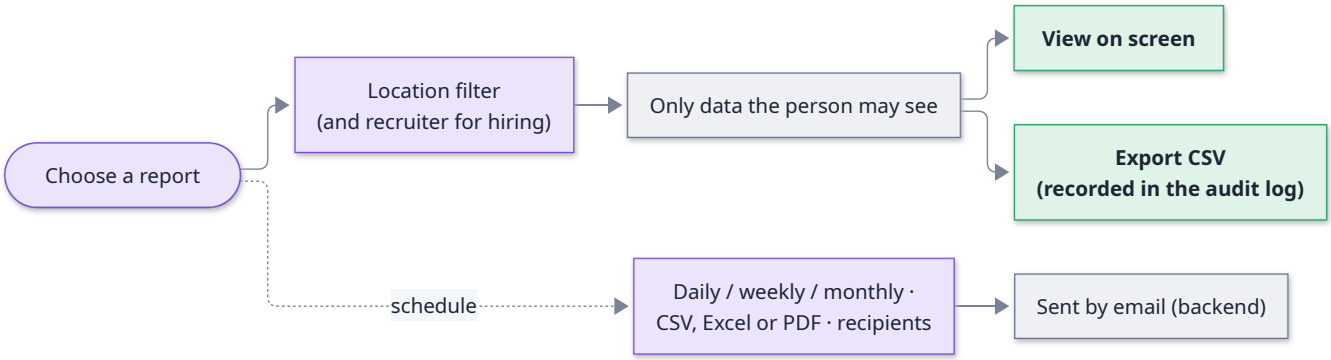

Hiring

Funnel, by source, rejection reasons, open-position age, time to hire, manager workload, recruiter figures

Hiring dashboard

Open positions, active candidates, interviews this week, pending offers, average time to hire, offer acceptance rate

Running a report

Not in the frontend yet

- Some reports are estimated from sample data. The backend calculates every report from real records.
- Scheduled reports are saved in the browser and never sent.
